Transportation Energy Data Book Edition 37

Stacy C. Davis and Robert G. Boundy

OAK RIDGE NATIONAL LABORATORY MANAGED BY UT-BATTELLE FOR THE US DEPARTMENT OF ENERGY

Transportation Energy Data Book Quick Facts

Petroleum

- In 2017 the U.S. produced more than 13 million barrels of petroleum per day (mmbd), or 14.2% of the world's 92.0 mmbd.
- The U.S. consumed 19.9 mmbd, or 20% of the world's 98.5 mmbd in 2017.
- Net imports of petroleum to the U.S. in 2017 were nearly 4 mmbd, which was 19% of U.S. petroleum.
- U.S. transportation petroleum use was 70% of total U.S. petroleum use in 2017.
- In 2017 U.S. transportation petroleum use was 106% of total U.S. petroleum production.
- Petroleum comprised 92% of U.S. transportation energy use in 2017.
- Cars and light trucks accounted for 63% of U.S. transportation petroleum use in 2016.
- Medium trucks (Class 3-6) accounted for 4% of U.S. transportation petroleum use in 2016.
- Heavy trucks (Class 7-8) and buses accounted for 19% of U.S. transportation petroleum use in 2016.
- Nonhighway modes accounted for the rest of U.S. transportation petroleum use in 2016 (14%).

Energy

- In 2017 U.S. transportation energy use accounted for about 29% of total U.S. energy use.
- Cars and light trucks accounted for 59% of U.S. transportation energy use in 2016.
- Medium trucks accounted for 5% of U.S. transportation energy use in 2016.
- Heavy trucks and buses accounted for 19% of U.S. transportation energy use in 2016.
- Nonhighway modes accounted for the rest of U.S. transportation energy use in 2016 (18%).

Light Vehicle Characteristics

- In 2016 there were 113 million cars and 133 million light trucks in the U.S. (246 million total light vehicles).
- Light vehicles accounted for 90% of the 3.2 trillion vehicle miles driven in the U.S. in 2016.
- U.S. cars:
 - $\circ~$ 6,080,000 cars were sold in 2017 which was 36% of new light vehicle sales.
 - In 2016 the average age of a U.S. car was 11.6 years.
 - In 2016 the average fuel economy for the U.S. car fleet (all cars on the road) was 26.8 mpg.
- U.S. light trucks:
 - 10,738,000 light trucks were sold in 2017 which was 64% of new light vehicle sales.
 - In 2016 the average age of a U.S. light truck was 11.6 years.
 - In 2016 the average fuel economy for the U.S. light truck fleet (all light trucks on the road) was 19.1 mpg.
- The average U.S. household vehicle travels 11,200 miles per year (2017 NHTS).

Heavy Truck Characteristics

- 11,499,000 heavy trucks were registered in the U.S. in 2016.
- Heavy trucks and buses accounted for 10% of the 3.2 trillion vehicle miles driven in 2016.
- In 2002 (the last time a survey was conducted), heavy trucks accounted for 80% of medium and heavy truck fuel use.

ACKNOWLEDGMENTS

The authors would like to express their gratitude to the many individuals who assisted in the preparation of this document. First, we would like to thank Rachael Nealer, Jacob Ward, Heather Croteau and the Vehicle Technologies Office staff for their continued support of the Transportation Energy Data Book project. We would also like to thank Mark Robbins for the cover design and David Gohlke for his thorough review of the report. We are indebted to Debbie Bain, who has masterfully prepared the manuscript since 1998.

This book would not be possible without the leadership, guidance, and vision of Phil Patterson, who began this book in the 1970's. We hope to continue this report into the future with the same level of excellence. The authors and the transportation research community will be forever grateful for his efforts.

xxii

ABSTRACT

The *Transportation Energy Data Book: Edition 37* is a statistical compendium prepared and published by Oak Ridge National Laboratory (ORNL) under contract with the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Vehicle Technologies Office. Designed for use as a desk-top reference, the Data Book represents an assembly and display of statistics and information that characterize transportation activity, and presents data on other factors that influence transportation energy use. The purpose of this document is to present relevant statistical data in the form of tables and graphs. The latest edition of the Data Book is available via the Internet (cta.ornl.gov/data).

This edition of the Data Book has 12 chapters which focus on various aspects of the transportation industry. Chapter 1 focuses on petroleum; Chapter 2 – energy; Chapter 3 – highway vehicles; Chapter 4 – light vehicles; Chapter 5 – heavy vehicles; Chapter 6 – alternative fuel vehicles; Chapter 7 – fleet vehicles; Chapter 8 – household vehicles; Chapter 9 – nonhighway modes; Chapter 10 – transportation and the economy; Chapter 11 – greenhouse gas emissions; and Chapter 12 – criteria pollutant emissions. The sources used represent the latest available data. There are also two appendices which include detailed source information for some tables and measures of conversion. A glossary of terms is also included for the reader's convenience.

xxiv

INTRODUCTION

In January 1976, the Transportation Energy Conservation (TEC) Division of the Energy Research and Development Administration contracted with Oak Ridge National Laboratory (ORNL) to prepare a Transportation Energy Conservation Data Book to be used by TEC staff in their evaluation of current and proposed conservation strategies. The major purposes of the Data Book were to draw together, under one cover, transportation data from diverse sources, to resolve data conflicts and inconsistencies, and to produce a comprehensive document. The first edition of the TEC Data Book was published in October 1976. With the passage of the Department of Energy (DOE) Organization Act, the work being conducted by the former Transportation Energy Conservation Division fell under the purview of the DOE's Office of Transportation Programs. This work continues today in the Vehicle Technologies Office.

Policymakers and analysts need to be well-informed about activity in the transportation sector. The organization and scope of the data book reflect the need for different kinds of information. For this reason, Edition 37 updates much of the same type of data that is found in previous editions.

In any attempt to compile a comprehensive set of statistics on transportation activity, numerous instances of inadequacies and inaccuracies in the basic data are encountered. Where such problems occur, estimates are developed by ORNL. To minimize the misuse of these statistics, an appendix (Appendix A) is included to document the estimation procedures. The attempt is to provide sufficient information for the conscientious user to evaluate the estimates and to form their own opinions as to their utility. Clearly, the accuracy of the estimates cannot exceed the accuracy of the primary data, an accuracy which in most instances is unknown. In cases where data accuracy is known or substantial errors are strongly suspected in the data, the reader is alerted. In all cases it should be recognized that the estimates are not precise.

The majority of the statistics contained in the data book are taken directly from published sources, although these data may be reformatted for presentation by ORNL. Consequently, neither ORNL nor DOE endorses the validity of these data.

| Table 1.16 | Highway share of transportation petroleum consumption, 2016 | | 86.2% |
| Table 1.16 | Light vehicle share of transportation petroleum consumption, 2016 | | 63.2% |

In this document, petroleum is defined as crude oil (including lease condensate) and natural gas plant liquids.

^a Organization for Economic Co-operation and Development.

As new technologies appear, and new areas are explored, the amount of proved reserves of crude oil and natural gas has grown. Although the reserves of natural gas in the United States were 60% higher in 2017 than it was in 1980, the U.S. share of World natural gas reserves is lower.

| | | il Reserves n barrels) | U.S. Share of Crude Oil | | Gas Reserves | U.S. Share of Natural Gas |
|-----------|---------|---------------------------|----------------------------|--------------------|---------------|------------------------------|
| Year | World | United States | Reserves | World | United States | Reserves |
| 1980 | 641.8 | 31.2 | 4.9% | 2,585.7 | 201.0 | 7.8% |

Table 1.1Proved Reserves of Crude Oil and Natural Gas, 1980–2017

Source:

U.S. Department of Energy, Energy Information Administration, *International Energy Statistics*, February 2018. (Additional resources: www.eia.doe.gov)

In 2017, the Organization of Petroleum Exporting Countries (OPEC) accounted for 43.3% of world oil production. World crude oil production reached an all-time high in 2017, while U.S. production was over 9 mmbd.

Table 1.2World Crude Oil Production, 1960–2017a(million barrels per day)

Source:

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, June 2018. (Additional resources: www.eia.doe.gov)

^a Includes lease condensate. Excludes natural gas plant liquids.

^b See Glossary for membership.

This table shows petroleum production, which includes both crude oil and natural gas plant liquids. Because other liquids and processing gain are not included, the world total is often smaller than world petroleum consumption (Table 1.4). The United States was responsible for 14.2% of the world's petroleum production in 2017 and 11.5% of the world's crude oil production (Table 1.2).

^a Includes natural gas plant liquids, crude oil and lease condensate. Does not account for all inputs or refinery processing gain.

^b Organization of Petroleum Exporting Countries. See Glossary for membership.

^c Not comparable with previous data. Includes other inputs and refinery processing gains.

During the 1980s and 1990s, the United States accounted for about one-quarter of the world's petroleum consumption, but from 2000 to 2012 that share had been decreasing. In 2017 the United States accounted for only 20.2%. World petroleum consumption decreased in 2008 but has continued to increase thereafter. Non-OECD consumption has continued to increase.

Energy Information Administration, International Energy Statistics, July 2018. (Additional resources: www.eia.doe.gov)

The share of petroleum imported to the United States can be calculated using total imports or net imports. Net imports, which are the preferred data, rose to over 50% of U.S. petroleum consumption for the first time in 1998, while total imports reached 50% for the first time in 1993. OPEC share of net imports has been below 50% since 1993. Due to rising petroleum exports, net imports have decreased substantially over the last five years, while total imports remained fairly constant.

| | Net OPEC ^a | Net OPEC ^a | | Net imports as a share | |

Table 1.6 U.S. Petroleum Imports, 1960–2017 (million barrels per day)

Source:

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, Washington, DC, March 2018, Table 3.3a. (Additional resources: www.eia.gov)

^a Organization of Petroleum Exporting Countries. See Glossary for membership.

More than half of the oil imported to the United States in 2017 was from the western hemisphere. Canada, Mexico, and Venezuela provided most of the oil from the western hemisphere, along with small amounts from Brazil, Columbia, Ecuador, and the U.S. Virgin Islands (these countries are not listed separately).

^a Organization of Petroleum Exporting Countries. See Glossary for membership.

The Strategic Petroleum Reserve (SPR) began in October 1977 as a result of the 1975 Energy Policy and Conservation Act. Its purpose is to provide protection against oil supply disruptions. The U.S. consumed 19.9 million barrels per day in 2017. At that rate of consumption, the SPR supply would last 33 days if used exclusively and continuously.

Table 1.8Crude Oil Supplies, 1973-2017

Sources:

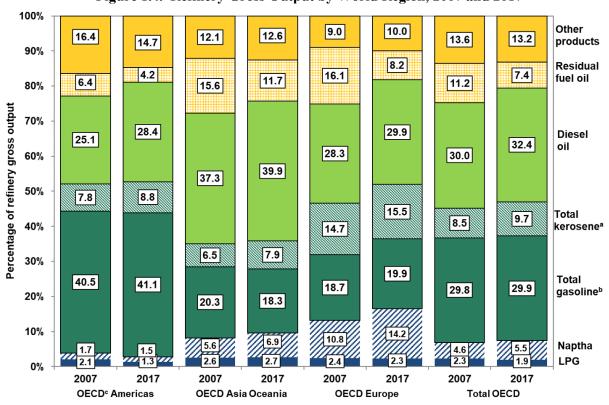

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, Washington, DC, March 2018, Tables 3.1 and 3.4. (Additional resources: www.eia.gov)

^b Strategic Petroleum Reserves divided by U.S. consumption per day. This would only hold true if the SPR were the only oil used for that many days.

^c Not applicable.

^a Other crude oil stocks include stocks held by petroleum companies, as well as stocks of Alaskan crude oil in transit.

Other parts of the world refine crude oil to produce more diesel fuel and less gasoline than the OECD Americas. The OECD Asia Oceania countries produce the lowest share of gasoline and highest share of diesel in 2017.

International Energy Agency, *Monthly Oil Survey*, December 2017 and *Monthly Oil Statistics*, December 2008. (Additional resources: www.iea.org)

^a Includes jet kerosene and other kerosene.

^b Includes motor gasoline, jet gasoline, and aviation gasoline.

^c Organization for Economic Cooperation and Development. See Glossary for membership.

Oxygenate refinery input increased significantly in 1995, most certainly due to the Clean Air Act Amendments of 1990 which mandated the sale of reformulated gasoline in certain areas beginning in January 1995. The use of MTBE has declined over the last 15 years due to many states banning the additive. The other hydrocarbons and liquids category includes unfinished oils, motor gasoline blending components and aviation gasoline blending components.

^a Methyl tertiary butyl ether (MTBE).

^b Includes methanol and other oxygenates.

^c Reported in "Other hydrocarbons and liquids" category in this year.

^d Data are not available.

When crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input, a processing volume gain occurs. Due to this gain, the product yield from a barrel of crude oil is more than 100%. For the last 20 years, the processing volume gain has been about 5-7%.

^a Includes aviation gasoline (0.1%), kerosene (0.0%), residual fuel oil (2.5%), naphtha and other oils for petrochemical feedstock use (1.1%), other oils for petrochemical feedstock use (0.7%), special naphthas (0.2%), lubricants (0.7%), petroleum coke (5.3%) asphalt and road oil (1.9%), still gas (4.0%), and miscellaneous products (0.6%).

^{(0.6%).} ^b Products sum to greater than 100% due to processing gain. The processing gain for years 1978 to 1980 is assumed to be 4 percent.

Domestic petroleum production increased in 2009 for the first time in 20 years and reached an all-time high of 13 mmbd in 2017. Most of the petroleum imported by the United States is in the form of crude oil. Exports were at an all-time high in 2017 as well, due to a lift of export restrictions in December 2015.

^a Total domestic production includes crude oil, natural gas plant liquids and small amounts of other liquids.

U.S. petroleum production has been increasing and petroleum imports decreasing from 2008 to 2017. Net imports of petroleum in 2017 were at the lowest level since 1970. In 2016, domestic production declined slightly, but rose to over 13 mmbd in 2017.

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, Washington, DC, March 2018, Tables 2.5, 3.1, and A3. (Pre-1973 data from the *Annual Energy Review*). World petroleum consumption - U.S. Department of Energy, Energy Information Administration, *International Energy Statistics* website, April 2018. (Additional resources: www.eia.doe.gov)

^a Total domestic production includes crude oil, natural gas plant liquids and small amounts of other liquids.

^b Data are not available.

Before 1989 the U.S. produced enough petroleum to meet the needs of the transportation sector but was still short of meeting the petroleum needs of all the sectors, including industrial, residential and commercial, and electric utilities. In 1973 the gap between what the U.S. produced and what was consumed was 5.8 million barrels per day. By 2050, the gap is expected to be only 1.5 million barrels per day if petroleum and other inputs are included or 2.9 million barrels per day if only conventional petroleum is used.

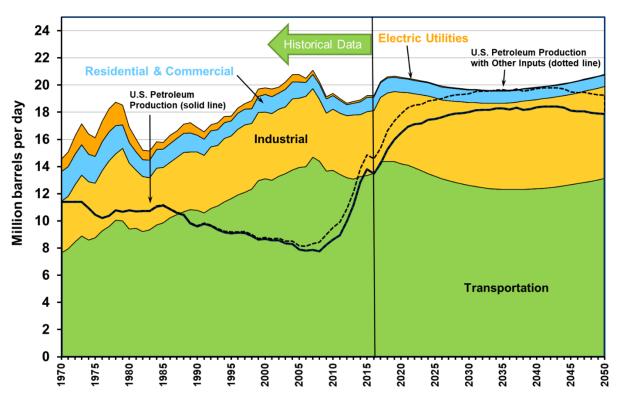

Figure 1.5. United States Petroleum Production and Consumption – All Sectors, 1970–2050

Notes: "Total U.S. Petroleum Production" includes crude oil, natural gas plant liquids, and refinery gains. It does not include dry natural gas.

"Total U.S. Petroleum Production" is for all uses.

"Total U.S. Petroleum Production with Other Inputs" also includes non-petroleum sources such as ethanol, biomass, liquids from coal, other blending components, other hydrocarbons, and ethers which were domestically produced.

The change from historical values to projected values is between 2016 and 2017.

The sharp increase in the value for heavy trucks between 2006 and 2007 is the result of the Federal Highway Administration's methodology change.

Sources:

Historical transportation petroleum use – See Tables 1.14 and 1.15. Historical petroleum use for other sectors – See Table 1.13. Historical U.S. petroleum production – Energy Information Administration, *Monthly Energy Review August 2018*, Table 3.1. Historical other inputs - Energy Information Administration, *Monthly Energy Review August 2018*, Tables 10.3 and 10.4. Forecasted petroleum use and petroleum production – Energy Information Administration, *Monthly Energy Review August 2018*, Tables 10.3 and 10.4. Forecasted petroleum use and petroleum production – Energy Information Administration, *2018 Annual Energy Outlook*, February 2018, reference case tables 7, 11, and 36.

In 1989, for the first time, petroleum consumption for transportation surpassed total U.S. petroleum production, which was declining. These contrasting trends in production and consumption created a gap that was met with foreign imports of petroleum. In 2009, however, the U.S. production of petroleum (for all uses including, but not limited to, transportation) began to increase substantially because of new hydraulic fracturing and oil extraction technology. In 2015, total production exceeded all transportation sector petroleum consumption. With other inputs included, such as ethanol, domestic production has exceeded transportation consumption since 2014. Transportation accounts for about 70% of all U.S. petroleum consumption.

The Energy Information Administration expects petroleum production to be greater than transportation consumption through 2050. Including non-petroleum sources such as ethanol, the production will exceed transportation demand by approximately six million barrels per day in 2050.

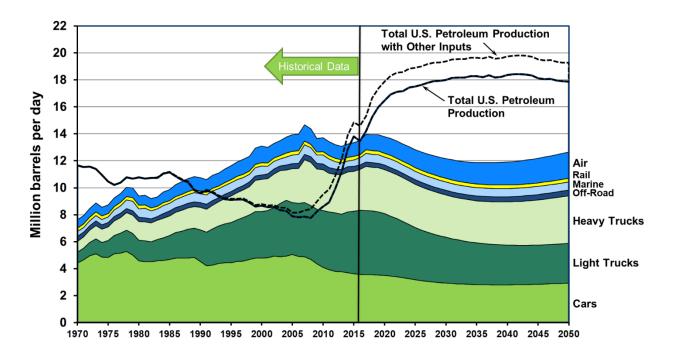

Figure 1.6. United States Petroleum Production and Transportation Consumption, 1970–2050

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, Washington, DC, March 2018, Tables 3.7a–3.7c. (Additional resources: www.eia.doe.gov)

Cars and light trucks use most of the petroleum in the transportation sector. Light trucks include pick-ups, minivans, sport-utility vehicles, and vans. See Table 2.9 for highway energy use in trillion Btu.

Table 1.14Highway Transportation Petroleum Consumption by Mode, 1970–2016a(thousand barrels per day)

Source:

See Appendix A, Section 2.1 Highway Energy Use.

^a Each gallon of petroleum product was assumed to equal one gallon of crude oil. The oil used to produce electricity is also estimated. See Appendix A, Section 2.4 for details.

^b Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g., snowmobiles).

^c Due to changes in the FHWA fuel use methodology, motorcycle, bus, and heavy truck data are not comparable with data before the year 2007. Car and light truck data changed after 2008; see Appendix A, Section 7, Car/Light Truck Shares.

Although 18% of transportation energy use is for nonhighway modes, only 14% of transportation petroleum use is for nonhighway. This is because some nonhighway modes, such as pipelines and transit rail, use electricity. An estimate for the petroleum used to make electricity is included in the data. See Table 2.10 for nonhighway transportation energy use in trillion Btu.

Table 1.16Transportation Petroleum Use by Mode, 2015–2016^a

Source:

See Appendix A, Section 2. Energy Use Sources.

^a Each gallon of petroleum product was assumed to equal one gallon of crude oil. The oil used to produce electricity is also estimated. See Appendix A, Section 2.4 for details.

^b Percentages may not sum to totals due to rounding.

^c Two-axle, four-tire trucks.

^d Civilian consumption only. Totals may not include all possible uses of fuels for transportation (e.g., snowmobiles).

^e Includes equipment that does not travel on roads, such as equipment from agriculture, construction, and airports.

Petroleum accounted for 35% of the world's energy use in 2015. Although petroleum and natural gas are the dominant energy sources for OECD countries, the non-OECD countries rely on coal and petroleum. The U.S. shares of primary energy sources are similar to the OECD countries as a whole, but with a lesser reliance on hydroelectric and renewables and a greater reliance on natural gas.

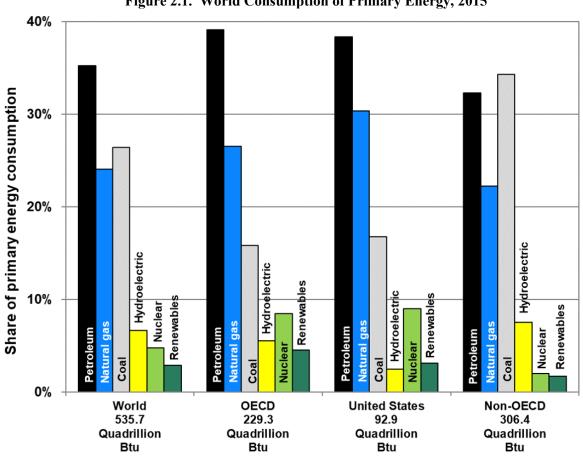

Figure 2.1. World Consumption of Primary Energy, 2015

Note: The United States data are shown separately but are also included in the OECD data.

Source:

U.S. Department of Energy, Energy Information Administration, International Energy Statistics, September 2018. (Additional resources: www.eia.doe.gov)

Total energy use was 97.8 quads in 2017 with transportation using 28.2%. The Energy Information Administration includes renewable energy in each sector.

Table 2.1U. S. Consumption of Total Energy by End-Use Sector, 1973–2017
(quadrillion Btu)

Source:

U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2018, Washington, DC, Table 2.1. (Additional resources: www.eia.doe.gov)

^a Electrical energy losses have been distributed among the sectors.

In transportation, the alcohol fuels blended into gasoline to make gasohol (10% ethanol or less) are counted under "renewables" and are not in with petroleum. The petroleum category, however, still contains other blending agents that are not actually petroleum but are not broken out into a separate category.

^a In transportation, the petroleum category contains some blending agents which are not petroleum.

^b Includes supplemental gaseous fuels. Transportation sector includes pipeline fuel and natural gas vehicle use. ^c Includes electrical system energy losses. Total transportation energy consumption was 28.2 quads in 2017. Petroleum has accounted for more than 90% of transportation energy consumption since the mid-1950's. Renewables, including ethanol and biodiesel, were 5% of the total in 2017.

In 2015, the United States and Russia were by far the top natural gas producing countries with more than triple that of any other country. Although the United States produced more than Russia, Russia has almost five times more reserves.

Note: Data for 2015 are the latest available.

Table 2.5Alternative Fuel and Oxygenate Consumption, 2005–2011
(thousand gasoline–equivalent gallons)

Note: These are the latest data available from the Energy Information Administration. See text box for additional information.

Source:

U.S. Department of Energy, Energy Information Administration, Alternative Fuel Vehicle Data website, May 2013, www.eia.doe.gov/renewable. (Additional resources: www.eia.doe.gov)

^a Consumption includes gasoline portion of the mixture.

^b Vehicle consumption only; does not include power plant inputs.

^c Methyl Tertiary Butyl Ether. This category includes a very small amount of other ethers, primarily Tertiary Amyl Methyl Ether (TAME) and Ethyl Tertiary Butyl Ether (ETBE).

Ethanol is an oxygenate blended with gasoline in amounts up to 10% to be used in conventional vehicles and is blended in higher amounts up to 85% for use in flex-fuel vehicles. The production of ethanol grew to over 15 billion gallons in 2016 and 2017, with consumption reaching over 14 billion gallons. Beginning in 2010, the United States began exporting more fuel ethanol than it imports. Biodiesel is a renewable fuel typically made from vegetable oils or animal fats. It can be burned in standard diesel engines and is often blended with petroleum diesel. In 2016, over 2.0 billion gallons of biodiesel were consumed.

^a Data are not available.

As data about alternative fuel use become available, an attempt is made to incorporate them into this table. Sometimes assumptions must be made in order to use the data. Please see Appendix A for a description of the methodology used to develop these data. See Table 1.16 for transportation petroleum use in thousand barrels per day.

Table 2.7 Domestic Consumption of Transportation Energy by Mode and Fuel Type, 2016^a (trillion Btu)

Source:

See Appendix A, Section 2. Energy Use Sources.

^a Civilian consumption only. Totals may not include all possible uses of fuels for transportation (e.g., snowmobiles).

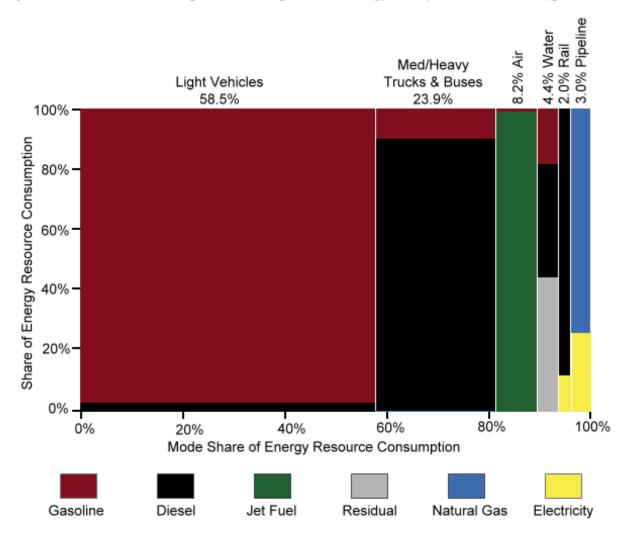

^b Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^c Totals may not sum due to rounding.

^d Two-axle, four-tire trucks.

^e One half of fuel used by domestic carriers in international operation.

The gasoline and diesel used in highway modes accounts for the majority of transportation energy use (82.4%) and nearly all highway use.

Note: Residual fuel oil is heavier oil which can be used in vessel bunkering.

Source:

See Table 2.7 or Appendix A, Section 2. Energy Use Sources.

^a Civilian consumption only. Totals may not include all possible uses of fuels for transportation (e.g., snowmobiles). Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

Nonhighway modes were responsible for 17.5% of all transportation energy use in 2016. See Table 1.16 for transportation energy use in thousand barrels per day.

Note: Totals may not add due to rounding.

Source:

See Appendix A, Section 2.1 Highway Energy Use.

^a Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g., snowmobiles). Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b Due to changes in the FHWA fuel use methodology, motorcycle, bus, and heavy truck data are not comparable with data before the year 2007. Car and light truck data changed after 2008; see Appendix A for car/light truck shares.

About 18% of transportation energy use is for nonhighway modes. Air travel accounts for 47% of nonhighway energy use. See Table 1.15 for nonhighway petroleum use in thousand barrels per day.

See Appendix A, Section 2.3 Nonhighway Energy Use.

^a Total transportation figures do not include military and off-highway energy use and may not include all possible uses of fuel for transportation (e.g., snowmobiles). Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

The Environmental Protection Agency's MOVES model estimates fuel use for different types of nonroad equipment and off-highway vehicles. Most of these vehicles/equipment use diesel fuel. Recreational equipment, such as offhighway motorcycles, snowmobiles, and all-terrain vehicles, are mainly fueled by gasoline.

| Table 2.11 |
|---|
| Off-Highway Transportation-Related Fuel Consumption, 2016 |
| (trillion Btu) |

Environmental Protection Agency, MOVES2014a model, www.epa.gov/otaq/models/moves.

^a There is no equipment listed for this fuel type.

The Federal Highway Administration (FHWA) cautions that data from 1993 on may not be directly comparable to earlier years. Some states have improved reporting procedures in recent years, and the estimation procedures were revised in 1994. The FHWA no longer publishes separate estimates of gasohol or ethanol used in gasohol.

| Year | Total gasoline and gasohol | Diesel ^a | Percent diesel | Total highway fuel use |

Table 2.12 Highway Usage of Gasoline and Diesel, 1973–2016 (billion gallons)

Source:

U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2016*, Washington, DC, 2017, Table MF-27 and annual. (Additional resources: www.fhwa.dot.gov)

^a Consists primarily of diesel fuel, with small quantities of other fuels, such as liquefied petroleum gas and E85.

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a mode.

Table 2.13Passenger Travel and Energy Use, 2016^a

Source:

See Appendix A, Section 3. Passenger Travel and Energy Use.

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b Demand response data are for 2015. Includes passenger cars, vans, and small buses operating in response to calls from passengers to the transit operator who dispatches the vehicles.

^c Data are not available.

^d Energy use is estimated.

^e Only domestic service and domestic energy use are shown on this table. (Previous editions included half of international energy.) These energy intensities may be inflated because all energy use is attributed to passengers–cargo energy use is not taken into account.

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences among the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes. These values are averages, and there is a great deal of variability even within a mode.

Table 2.14Energy Intensities of Highway Passenger Modes, 1970–2016

Source:

See Appendix A, Section 4. Highway Passenger Mode Energy Intensities.

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b All two-axle, four-tire trucks.

^c Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transportation Association (APTA).

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences between the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes.

Table 2.15Energy Intensities of Nonhighway Passenger Modes, 1970–2016^a

Source:

See Appendix A, Section 5. Nonhighway Passenger Mode Energy Intensities.

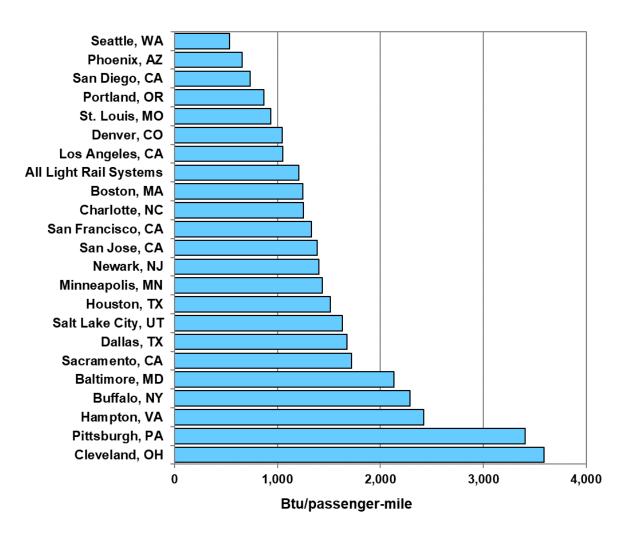

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b These data differ from the data on Table 2.13 because they include half of international services. These energy intensities may be inflated because all energy use is attributed to passengers–cargo energy use is not taken into account.

^c Data are not available.

^d Average annual percentage calculated to earliest year possible.

The energy intensity of light rail systems, measured in Btu per passenger-mile, varies greatly. The weighted average of all light rail systems in 2016 is 1,206 Btu/passenger-mile.

Source:

U.S. Department of Transportation, 2016 National Transit Database, August 2018. (Additional resources: www.transit.dot.gov/ntd)

^a Typically an electric railway with a light volume traffic capacity with power drawn from an overhead electric line. Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

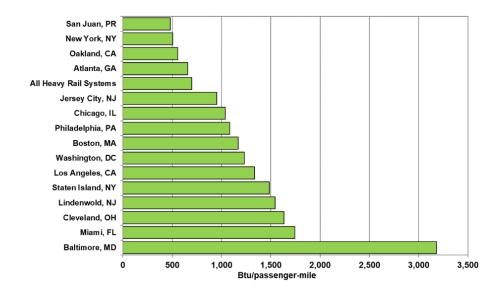

Figure 2.8. Energy Intensity of Heavy Rail Systems^a, 2016

Source:

U.S. Department of Transportation, 2016 National Transit Database, August 2018. (Additional resources: www.transit.dot.gov/ntd)

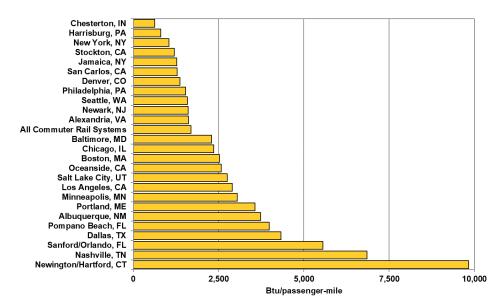

Figure 2.9. Energy Intensity of Commuter Rail Systems^b, 2016

Note: Does not include systems classified as hybrid rail.

Source:

U.S. Department of Transportation, 2016 National Transit Database, August 2018. (Additional resources: www.transit.dot.gov/ntd)

^a An electric railway with the capacity for a heavy volume of traffic. Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b Electric car or diesel-propelled railway for urban passenger train service between a central city and adjacent suburbs. Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

Great care should be taken when comparing modal energy intensity data among modes. Because of the inherent differences between the transportation modes in the nature of services, routes available, and many additional factors, it is not possible to obtain truly comparable national energy intensities among modes.

Table 2.16Energy Intensities of Freight Modes, 1970–2016

Source:

See Appendix A, Section 6. Freight Mode Energy Intensities.

^a Data are not available.

^b Due to changes in the FHWA fuel use methodology, truck data are not comparable with data before the year 2007.

Chapter 3 All Highway Vehicles and Characteristics

Summary Statistics from Tables in this Chapter

| Source | | |
|------------|---|-----------|
| Table 3.2 | U.S. share of world car registrations, 2016 | 12.7% |
| Table 3.3 | U.S. share of world truck & bus registrations, 2016 | 42.1% |
| Table 3.4 | Number of U.S. cars, 2016 (thousands) | 112,961 |
| Table 3.4 | Number of U.S. trucks, 2016 (thousands) | 146,182 |
| Table 3.8 | Vehicle miles traveled, 2016 (million miles) | 3,174,408 |
| | Cars | 45.8% |
| | Two-axle, four-tire trucks | 44.0% |
| | Combination trucks | 5.5% |
| | Other single-unit trucks | 3.6% |
| | Motorcycles | 0.6% |
| | Buses | 0.5% |
| Table 3.11 | Average age of vehicles, 2016 | |
| | Cars (years) | 11.6 |
| | Light trucks (years) | 11.6 |
| | All light vehicles (years) | 11.6 |

The top countries producing the world's cars and trucks have changed over the last 16 years. In 2016, China was the largest producer of cars and trucks. In 2000, Japan produced the most cars and the United States produced the most trucks (includes light trucks).

| | 2000 | 2016 | Percent change |
|---------------------|--------|--------|----------------|
| Cars | 2000 | 2016 | 2000-2016 |
| China | 605 | 13,129 | 2,071% |
| Japan | 8,363 | 7,874 | -6% |

| Table 3.1 |
|--|
| World Production of Cars and Trucks, 2000 and 2016 |
| (thousands) |

Source:

Ward's Communications, www.wardsauto.com.

^a Includes light trucks, heavy trucks, and buses.

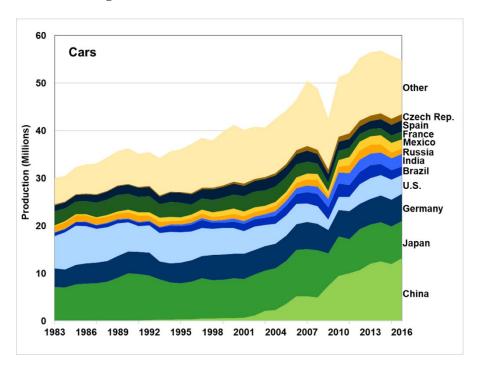

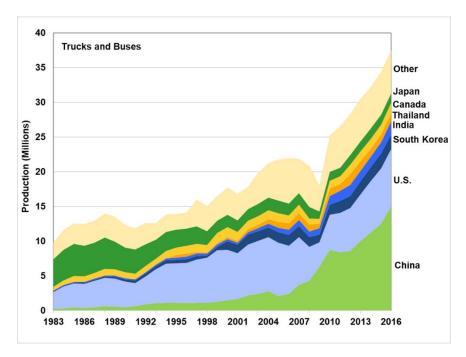

Figure 3.1. World Car Production, 1983–2016^a

Figure 3.2. World Truck and Bus Production, 1983–2016^a

^a The sharp decrease in 2009 coincides with the recession. Note that the scales of the two figures differ.

Use caution comparing historical data because of disconnects in data series and definitional differences among countries. The United States uses light trucks (SUVs, minivans, pickups) for personal travel which are not counted as cars in this table. China's light trucks were not counted in this table until 2014, when a reclassification of vehicle types added them as cars. The U.S. share of world cars continues to decline. The growth in the World total comes mainly from developing countries, like China, Indonesia, India, and South Korea.

Source:

Ward's Communications, www.wardsauto.com.

^a Data are not available.

^b Data from 2000 and later are not comparable to prior data. Canada reclassified autos and trucks prior to 2000.

^c Light trucks were reclassified into the car category in 2014.

^d Data for 1990 and prior include West Germany only. Kraftwagen are included with automobiles.

^e Data for earliest year available.

Use caution comparing historical data because of disconnects in data series and definitional differences among countries. The United States totals include SUVs, minivans, and light trucks, many of which are used for personal travel. Thus, countries that only use trucks for freight movement will not be comparable to the United States. China's light trucks were included in this table until a reclassification in 2014.

Table 3.3 Truck and Bus Registrations for Selected Countries, 1960–2016 (thousands)

Source:

Ward's Communications, www.wardsauto.com.

^a Data are not available.

^b Data from 2000 and later are not comparable to prior data. Canada reclassified autos and trucks prior to 2000.

^c Light trucks were reclassified into the car category in 2014.

^d Data for 1990 and prior include West Germany only. Kraftwagen are included with automobiles.

VEHICLES IN USE

Both the Federal Highway Administration (FHWA) and IHS Automotive report figures on the car and truck population each year. The two estimates, however, differ by as much as 11.2% (1981). The differences can be attributed to several factors:

- The FHWA data include all vehicles which have been registered at any time throughout the calendar year. Therefore, the data include vehicles which were retired during the year and may double count vehicles which have been registered in different states or the same states to different owners. IHS Automotive data include only those vehicles which are registered on July 1 of the given year and would not include vehicles registered after that date.
- The classification of mini-vans, station wagons on truck chassis, and utility vehicles as cars or trucks causes important differences in the two estimates. IHS Automotive data included passenger vans in the car count until 1980; since 1980 all vans have been counted as trucks.
- Starting in 1993, the FHWA reclassified some minivans and sport utility vehicles into the truck category which were previously included with cars. This change produced a dramatic change in the individual percentage differences of cars and trucks. The difference in total vehicles has been less than 5% each year since 1990 and does not appear to be significantly affected by the FHWA reclassifications. Beginning with 2009, the FHWA discontinued the car/2-axle, 4-tire truck designations on Table VM-1. The data since 2009 come from Tables MV-1 and MV-9.
- The FHWA data include all non-military Federal vehicles, while IHS Automotive data include only those Federal vehicles which are registered within a state. Federal vehicles are not required to have State registrations, and, according to the General Services Administration, most Federal vehicles are not registered.
- In 2012 both IHS Automotive and FHWA changed their methodologies for the car/light truck split which created a significant decrease in the number of cars reported and a corresponding increase in the number of light trucks.

In the early 1980's, researchers had to make a conscious choice of which data series to use, since they differed by as much as 11%. In 2005 the two sources differed by less than 1%. Both sources changed their methodologies for the car/light truck split causing significant decreases to the number of cars in 2012.

Table 3.5 New Retail Vehicle Sales, 1970–2017 (thousands)

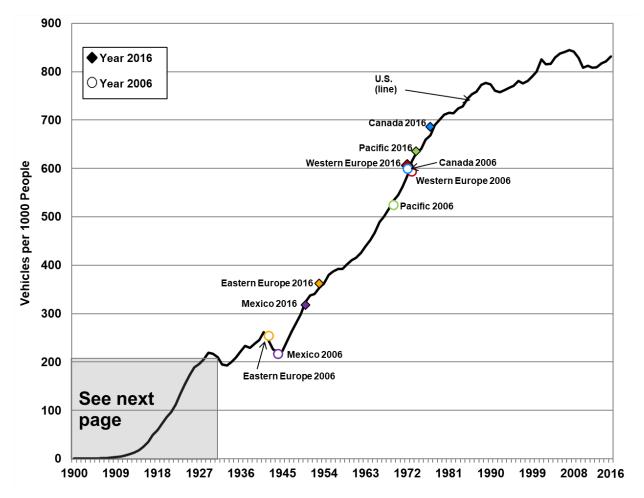

Source:

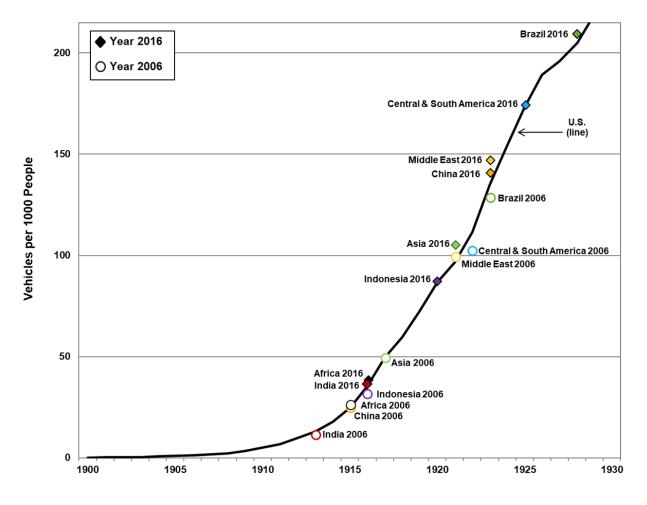

Ward's Communications, www.wardsauto.com.

^a Includes light trucks of 10,000 lb. gross vehicle weight and less.

The graphs below show the number of motor vehicles per thousand people for various countries. The data for the United States are displayed in the line which goes from 1900 to 2016. The points labeled on that line show data for the other countries/regions around the world and how their vehicles per thousand people compare to the United States at two different points in time, 2006 and 2016. For instance, the graph shows that in 2006, Eastern Europe's vehicles per thousand people was about where the United States was in 1942, but by 2016 it is about where the United States was in 1953. The lower part of the graph (1900-1930) is shown enlarged on the facing page.

Source: See Tables 3.5 and 3.6.

Though some countries are listed separately in this table, those countries are also included in the regional total. For instance, China is listed separately, but is also included in the Asia, Far East region.

| | Vehicles per | 1,000 people |
|-------------------------|--------------|--------------|
| Country/Region | 2006 | 2016 |
| Africa | 25.2 | 38.9 |

 Table 3.6

 Vehicles per Thousand People in Selected Countries/Regions, 2006 and 2016

Sources:

2016 population – U.S. Census Bureau, Population Division, International Data Base (IDB) World, July 31, 2018. (Additional resources: www.census.gov/population/international)

2016 vehicles – United States: See Table 3.6. All other countries: Ward's Communications, www.wardsauto.com. 2006 data – Oak Ridge National Laboratory, *Transportation Energy Data Book: Edition 27*, ORNL-6981, 2008.

The number of vehicles per thousand people in the United States has grown tremendously since 1900. After a peak in 2007 at 844.5, the number declined but began rising in 2012. By 2016 there were 831.9 vehicles per thousand people in the United States.

Table 3.7Vehicles per Thousand People in the United States, 1900–2016

Sources:

Population – U.S. Census Bureau, Population Division, International Data Base (IDB) World, February 2018. (Additional resources: www.census.gov/programs-surveys/international-programs.html)

Vehicles – U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2016*, Washington, DC, 2017.

Total vehicle-miles traveled increased each year from 2011 to 2016. The trend of using two-axle, four-tire trucks, such as pickups, vans, and sport-utility vehicles, for personal travel is evident in these data; two-axle, four-tire trucks account for 33% more travel in 2016 than in 1970, and cars account for 37% less travel in that time period.

| | - | | Two-axle, four-tire | Other single-unit | Combination | | Total vehicle-miles traveled |
|-----------|----------------|-------------|------------------------|----------------------|-------------|-------|------------------------------------|

Table 3.8Shares of Highway Vehicle-Miles Traveled by Vehicle Type, 1970–2016

Source:

U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2016*, Washington, DC, 2017, Table VM-1 and annual. (Additional resources: www.fhwa.dot.gov). 2009-2016 cars and 2-axle 4-tire trucks – see Section 7 in Appendix A.

^a Due to FHWA methodology changes, data from 2007-on are not comparable with previous data.

In 1970 only 2.9% of the car population was 15 years old or older; by 2013 that number rose to nearly 20%.

Table 3.9Cars in Operation by Age, 1970, 2000, and 2013

Source:

IHS Automotive, Detroit, MI. Used with permission. FURTHER REPRODUCTION PROHIBITED.

^a Percentages may not sum to totals due to rounding.

^b Includes cars which were sold prior to July 1, 1970, and similarly, sold prior to July 1, 2000. For 2013, cars sold prior to December 31, 2013 were included.

The number of trucks in the United States has grown significantly since 1970, some of it due to the use of light trucks (pickups, vans, sport utility vehicles) as personal passenger vehicles. Those light trucks, as well as medium and heavy trucks, are included in the data. In 1970 about 15% of trucks were age 15 or older; by 2013, that increased to 20.8%.

Table 3.10Trucks in Operation by Age, 1970, 2000, and 2013

Source:

IHS Automotive, Detroit, MI. Used with permission. FURTHER REPRODUCTION PROHIBITED.

^a Percentages may not sum to totals due to rounding.

^b Includes trucks which were sold prior to July 1, 1970, and similarly, sold prior to July 1, 2000. For 2013, trucks sold prior to December 31, 2013 were included.

The average age of cars and light trucks has grown to a record level in 2016—11.6 years. Light trucks, which include pickups, vans, and sport utility vehicles, previously had a lower average age than cars. In 2014 through 2016, however, there is no difference in their ages.

Table 3.11U.S. Average Vehicle Age, 1970–2016

Note: Data for 2016 are the latest available.

Source:

IHS Automotive, Detroit, MI. Used with permission. **FURTHER REPRODUCTION PROHIBITED**. (Additional resources: https://www.ihs.com/industry/automotive.html)

^a In 2013, IHS Automotive published a data series showing vehicle age from 2002-2013. These data did not match the previous data published by IHS Automotive. The data prior to 2002 came from earlier IHS Automotive news releases and is not comparable to the revised data.

The Environmental Protection Agency estimated the annual vehicle miles of travel for cars and light trucks up to 30 years old for the mid-term evaluation of the Light Vehicle Greenhouse Gas Emissions Standards and Corporate Average Fuel Economy Standards. The "Total" row represents the number of miles a car or light truck would travel if it is in operation for 30 years. Typical lifetime miles from a 2006 study by the National Highway Traffic Safety Administration (NHTSA) are shown below the total.

| | Estimated annual | Estimated annual |
|---|------------------|-------------------------|

Using current registration data and a scrappage model by Greenspan and Cohen [1996 paper: www.federalreserve.gov/pubs/feds/1996/199640/199640pap.pdf], ORNL calculated heavy truck (trucks over 26,000 lb gross vehicle weight) scrappage rates. The expected median lifetime for a 1990 model year heavy truck is 29 years. These data are fitted model values which assume constant economic conditions.

| Vehicle | 1970 m | odel year | 1980 m | odel year | 1990 m | odel year |
|-----------------------------|-------------------------------|--------------------------------|-------------------------------|--------------------------------|-------------------------------|-------------------------------|

The definition of light truck can change from table to table in this document due to differing definitions among federal government regulations and public nomenclature. See page 4-2 for additional information.

Definition of Light Truck

Often for regulatory purposes, agencies within the federal government have differing definitions for the term "light truck." Private data collectors, such as Ward's Communications or IHS Automotive/Polk, have their own definitions as well. The paragraphs below are intended as a guide to the different definitions which are used in this document.

The data on Table 4.2 are from the Federal Highway Administration (FHWA). From 1970 to 2008 the FHWA defined light trucks as two-axle, four-tire trucks, including pickups, vans, SUVs, and other two-axle, four-tire trucks under 10,000 lb gross vehicle weight rating (GVWR). In 2009, the FHWA changed methodologies and no longer publishes vehicle miles, fuel use, and fuel economy of light trucks separately from cars. They continue to publish vehicle registrations for pickups, vans, SUVs and other two-axle, four tire trucks under 10,000 lb. The methodology used by Oak Ridge National Laboratory (ORNL) to continue the data series on Table 4.2 after 2008 is based on the FHWA data for all light vehicles, thus uses the same definition of light trucks. See Section 7.2 in Appendix A for the methodology of light truck data on Table 4.2 after 2008. Data on energy use in Tables 2.7 through 2.9 also use the FHWA definition of light truck.

Tables 3.11, 4.4, 4.5, and 4.7 are light truck sales based on Ward's Communications data. Ward's definition of light trucks includes pickups, vans, SUVs, and specialty purpose vehicles up to 14,000 lb GVWR. However, in most cases, data are available by individual GVWR and ORNL summarized only light trucks that were 10,000 lb GVWR or less and did not include the heavier trucks. Thus, the definition on these tables is nearly identical to the FHWA definition.

The Environmental Protection Agency (EPA) and the Department of Transportation, National Highway Traffic Safety Administration (NHTSA), issued joint rulemaking to establish Corporate Average Fuel Economy (CAFE) standards and greenhouse gas emissions standards beginning with model year 2012. The rulemaking established new definitions of cars and light trucks. Before the rule, CAFE standards applied to cars and light trucks (pickups, vans, SUVs, and other trucks) less than 8,500 lb GVWR. After the rule, some two-wheel drive SUVs are considered cars instead of light trucks, and personal passenger vehicles (vans and SUVs) up to 10,000 lb GVWR are considered light trucks. Thus, data are now categorized as cars, car SUVs, truck SUVs, pickups and vans. Table 4.9 gives a listing of which SUVs are considered car SUVs for model year 2016. The EPA revised their data series back to 1975, so the definitions are consistent historically. Data on tables 4.8 through 4.15 are based on EPA data and thus use this definition of cars and light trucks. The CAFE data on Table 4.21 apply to cars only through 2011 and cars plus car SUVs after that are for truck SUVs and vans up to 10,000 lb GVWR, and pickup trucks up to 8,500 lb GVWR.

Because of these different definitions, caution is advised when comparing light truck data from different sources.

The data in this table from 1985–on DO NOT include minivans, pickups, or sport utility vehicles. Much of the data for 2009-on were estimated; the FHWA no longer publishes travel and fuel data for cars. A methodology change for the number of cars registered affected the series in 2012.

| Year | Registrations ^a (thousands) | Vehicle travel (billion miles) | Average annual miles per vehicle | Fuel use (million gallons) | Average fuel economy ^b per vehicle (miles per gallon) |
|-----------|---|-----------------------------------|----------------------------------|-------------------------------|--|
| 1970 | 89,244 | 916.7 | 10,272 | 67,820 | 13.5 |
| 1975 | 106,706 | 1,034.0 | 9,690 | 74,140 | 13.9 |

Table 4.1Summary Statistics for Cars, 1970–2016

Source:

1970-2008: U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2009*, Washington, DC, 2011, Table VM-1 and annual. 2009-on: See Section 7.1 in Appendix A. (Additional resources: www.fhwa.dot.gov)

^a This number differs from IHS Automotive's estimates of "number of cars in use." See Table 3.4.

^b Average fuel economy for all cars.

^c Beginning in this year the data were revised to exclude minivans, pickups and sport utility vehicles which may have been previously included.

^d Due to FHWA methodology changes, data from 2009-on are not comparable with previous data.

4–3

Much of the data for 2009-on were estimated; the FHWA no longer publishes travel and fuel use data for two-axle, four-tire trucks. A methodology change for the number of registrations affected the data series in 2012.

| Year | Registrations (thousands) | Vehicle travel (billion miles) | Average annual miles per vehicle | Fuel use (million gallons) | Average fuel economy ^a per vehicle (miles per gallon) |

Table 4.2Summary Statistics for Two-Axle, Four-Tire Trucks, 1970–2016

Source:

1970-2008: U.S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2009*, Washington, DC, 2011, Table MV-9. Previous years Table VM-1. 2009-on: See Section 7.2 in Appendix A. (Additional resources: www.fhwa.dot.gov)

^a Average fuel economy for all two-axle, four-tire trucks.

^b Beginning in this year the data were revised to include all vans (including mini-vans), pickups and sport utility vehicles.

^c Due to FHWA methodology changes, data from 2009-on are not comparable with previous data.

These data are the combination of the car and two-axle, four-tire truck data from Tables 4.1 and 4.2 thus the data may not match exactly with the FHWA VM-1 table's light-duty vehicle data. The methodology change after 2008 affects these data as well.

| Year | Registrations (thousands) | Vehicle travel (billion miles) | Average annual miles per vehicle | Fuel use (million gallons) | Average fuel economy ^a per vehicle (miles per gallon) |

Table 4.3Summary Statistics for Light Vehicles, 1970–2016

Sources:

Tables 4.1 and 4.2.

^a Average fuel economy for all light vehicles.

^b Beginning in this year the data were revised to include all vans (including mini-vans), pickups and sport utility vehicles.

^c Due to FHWA methodology changes, data from 2009-on are not comparable with previous data.

Because data on class 2b trucks are scarce, the U.S. DOE funded a study to investigate available sources of data. In the final report, four methodologies are described to estimate the sales of class 2b trucks. The 1999 data are the latest available for fuel use and vehicle miles of travel of class 2b trucks.

| | | | | | | | Estimated |
|-------------------------------|-------------|------------|------------|---------|--------------------|-----------------------|------------|
| | | 2000 | Percent | | Estimated | Estimated | fuel |
| | CY 1999 | truck | diesel | Average | annual | fuel use | economy |
| | truck sales | population | trucks in | age | miles ^a | (billion ^a | (miles per |
| Class (truck weight) | (millions) | (millions) | population | (years) | (billions) | gallons) | gallon) |
| Class 1 (0-6,000 lbs) | 5.7 | 49.7 | 0.3% | 7.3 | 672.7 | 37.4 | 18.0 |
| Class 2a (6,001 - 8,500 lbs) | 1.8 | 19.2 | 2.5% | 7.4 | 251.9 | 18.0 | 14.0 |
| Class 2b (8,501 – 10,000 lbs) | 0.5 | 5.8 | 24.0% | 8.6 | 76.7 | 5.5 | 13.9 |

Car sales in 2009 and 2010 were below 6 million but increased to more than 7.7 million by 2014 before declining from 2015 to 2017. In 1980, Chrysler/FCA, Ford and General Motors held 73.8% of the market; by 2017, that had dropped to 25.8%.

Table 4.6New Retail Car Sales in the United States, 1970–2017

Source:

Domestic and import data - 1970–97: American Automobile Manufacturers Association, *Motor Vehicle Facts and Figures 1998*, Detroit, MI, 1998, p. 15, and annual. 1997 data from *Economic Indicators, 4th Quarter 1997*. 1998–2017: Ward's Communication, www.wardsauto.com.

Diesel data - Ward's Communications, www.wardsauto.com.

^a Any vehicle built in North America regardless of manufacturer.

^b Any vehicle built outside of North America regardless of manufacturer. Does not include import tourist deliveries.

^c Sums may not add to totals due to rounding.

^d Includes Ford, General Motors, and Fiat-Chrysler (and predecessor entities).

^e Data are not available.

Light trucks, which include pick-ups, minivans, sport-utility vehicles, and other trucks less than 10,000 pounds gross vehicle weight (GVW), accounted for more than half of light vehicle sales from 2001 to 2007 and again in 2010, 2011, and from 2013-on. In 2017, nearly 64% of light vehicles sold were light trucks.

Source:

Ward's Communications, www.wardsauto.com.

^a Includes all trucks of 10,000 pounds gross vehicle weight and less sold in the United States.

^b Excluding transplants.

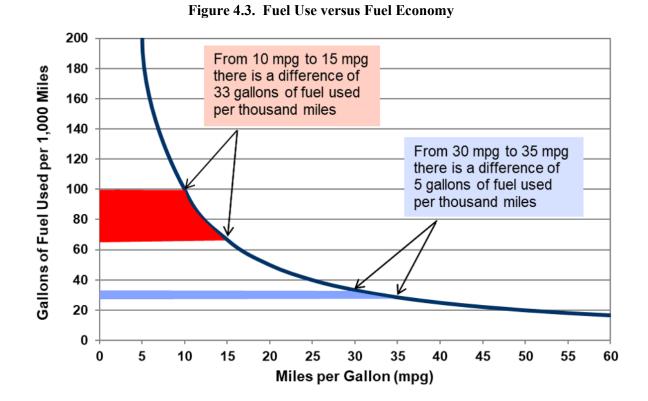

[°] Includes Ford, General Motors, and Fiat-Chrysler (and predecessor entities).

^d Based on model year factory installations.

^e Includes cars and light trucks up to 10,000 lb gross vehicle weight.

^f Indicates less than 1 percent.

The relationship between gallons used over a given distance and miles per gallon (mpg) is not linear. Thus, an increase in fuel economy by 5 mpg does not translate to a constant fuel savings amount. Replacing a low-mpg car or truck with one that has just slightly better fuel economy will save more fuel than replacing a high-mpg car or truck with a more efficient vehicle. For example, replacing a truck that gets 10 mpg for a new one that gets 15 mpg will save 33 gallons of fuel for every 1,000 miles driven. In contrast, replacing a 30-mpg car with a new car that gets 35 mpg will save 5 gallons of fuel for every 1,000 miles driven.

Note: Each category on the horizontal axis shows a five-mile per gallon improvement in fuel economy.

Source:

U.S. Department of Energy fuel economy data www.fueleconomy.gov.

The production-weighted fuel economy of cars increased dramatically from 1975 (13.5 mpg) to 1985 (23.0 mpg), but rose only 0.5 mpg from 1985 to 2005. Since 2005, fuel economy rose 6.5 mpg—from 23.5 mpg in 2005 to 30.0 mpg in 2017. The fuel economy values have been adjusted to provide the best estimate of real world performance.

^a The fuel economy data on this table are adjusted to provide the best estimate of real world performance. See section 10 of the source document for details on adjustment methodology. These data are typically 20-25% lower than Corporate Average Fuel Economy data.

^b Production share is based on total of cars plus car SUVs. Percentages may not sum to totals due to rounding.

^c Data for 2017 are preliminary.

^d Data are not available.

A vehicle classification was created to match the Corporate Average Fuel Economy (CAFE) methodology. Under CAFE, small, two-wheel drive sport utility vehicles will be held to the same standards as cars. The Environmental Protection Agency has defined these vehicles as "car SUVs." The vehicles below make up this category.

| Acura RDX FWD | Jeep Compass 4X2 |
|---------------------------------------|--------------------------------|
| Bentley Bentayga | Jeep Compass FWD |
| BMW X3 sDrive 28i | Jeep Patriot FWD |
| Buick Encore | Jeep Renegade 4x2 |
| Buick Envision FWD | Kia Sorento AWD |
| BYD Motors e6 | Kia Sorento FWD |
| Cadillac XT5 | Kia Sportage FE FWD |
| Cadillac XT5 AWD | Kia Sportage FWD |
| Chevrolet Equinox AWD | Lexus NX 200t |
| Chevrolet Equinox FWD | Lexus NX 200t AWD F Sport |
| Chevrolet TRAX | Lexus RX 350 |
| Dodge Journey | Lincoln MKC FWD |
| Fiat 500X | Lincoln MKX FWD |
| Ford Edge FWD | Mazda CX-5 2WD |

^a Alternative fuel vehicle.

Production of sport utility vehicles (SUVs) has grown substantially since 1975. The production-weighted fuel economy of truck SUVs was more than 22 mpg in 2017. Estimates show 64% of all light trucks produced in 2017 were truck SUVs.

 Table 4.10

 Production, Production Shares, and Production-Weighted Fuel Economies of New Domestic and Import Light Trucks, Model Years 1975-2017^a

Note: Data include pickups, vans, and truck SUV less than 8,500 lb. Beginning with 2011, truck SUV and passenger vans up to 10,000 lb were also included. See Table 4.11 for all light trucks (pickup + van + truck SUV).

Source:

U.S. Environmental Protection Agency, Light-Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends: 1975 Through 2017, January 2018. (Additional resources: www.epa.gov/fuel-economy-trends)

^a The fuel economy data on this table are adjusted to provide the best estimate of real world performance. See section 10 of the source document for details on adjustment methodology. These data are typically 20-25% lower than Corporate Average Fuel Economy data.

^b Production share is based on the total of pickups, plus vans and truck SUVs. Percentages may not sum to totals due to rounding.

^c Data for 2017 are preliminary.

^d Data are not available.

The average fuel economy of cars more than doubled from 1975 to 2017 while the average fuel economy of light trucks grew by 82% in that same time period. This was not steady annual growth, but growth in the 1970's and early 1980's followed by a long period with little improvement. Growth resumed around 2008-2009.

^a The fuel economy data on this table are adjusted to provide the best estimate of real world performance. See section 10 of the source document for details on adjustment methodology. These data are typically 20-25% lower than Corporate Average Fuel Economy data.

^c Data are not available, but 58.1% of all light vehicles were cars (car + car SUV) and 41.9% were light trucks (pickups, vans, and truck SUV) in 2017.

^b Data for 2017 are preliminary.

Back in 1975 only 19.3% of new light vehicles produced were light trucks. Because of the boom in production of minivans, sport utility vehicles, and pick-up trucks, that number rose to over 40% in 1998. The car SUV category was 11% of production in 2017 and the truck SUVs were nearly 27%.

 Table 4.12

 Light Vehicle Production Shares^a, Model Years 1975–2017

Note: Light truck data include pickups, vans, and truck SUVs less than 8,500 lb. Beginning with 2011, SUV and passenger vans up to 10,000 lb were also included.

Source:

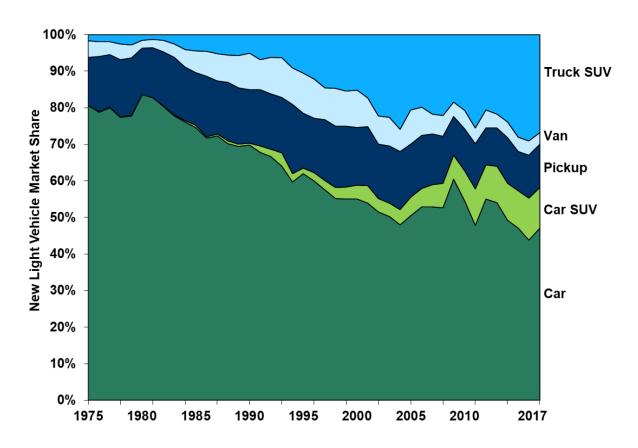

^a Percentages may not sum to totals due to rounding.

^b Cars include both car and car SUV categories.

^c Data for 2017 are preliminary.

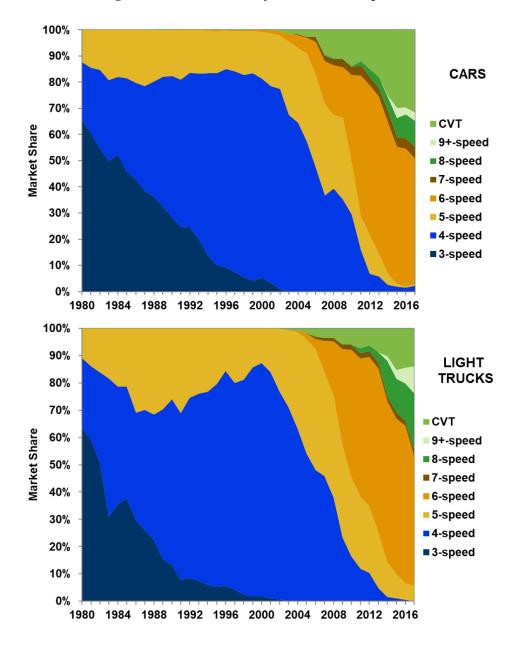

^d Data are not available.

The effects of the Japanese earthquake/tsunami in 2011 are apparent in the large decline in car production for that year. Light trucks were gaining market share from the early 1980s until 2004, mainly due to increases in the market share of sport utility vehicles (SUVs) and pickup trucks. Car SUVs are two-wheel drive SUVs that are counted as cars in the Corporate Average Fuel Economy Standards for model years 2011-on. A listing of the makes/models of car SUVs is in Table 4.9.

Source: See Table 4.12. The number of transmission speeds in new light vehicles has been growing over the last few decades. A greater number of gears improves fuel economy and performance by more closely matching the wheel speed to the optimum engine speed. By 2017, 48% of cars and 47% of light trucks were 6-speed. The sales share of light truck transmissions in the 9+ category grew to 10% in 2017. Continuously variable transmissions (CVTs) were almost one-third of the car market and 14% of the light truck market.

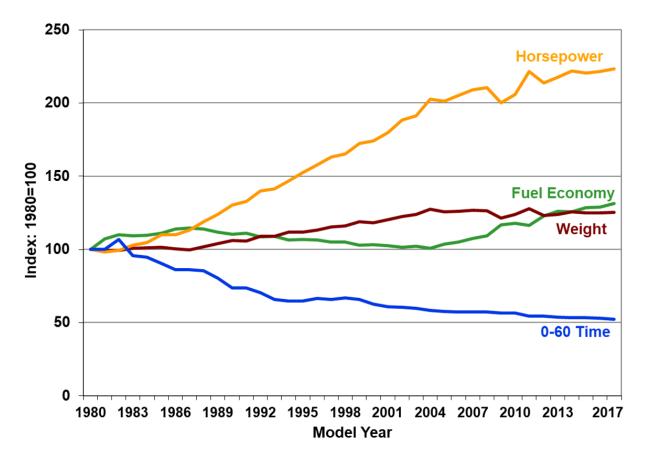

Note: Data are production-weighted averages for each model year. Data for model year 2017 are preliminary. CVT data include both hybrid and non-hybrid. Data include light trucks less than 8,500 lb. Beginning with 2011, SUVs and passenger vans up to 10,000 lb were also included.

Source:

Increased performance typically comes as a trade-off with fuel economy. But light vehicle manufacturers have been able to employ advanced technologies to improve both performance and fuel economy. Despite a 123% increase in horsepower and 48% improvement in acceleration (measured by time to accelerate from 0 to 60 miles per hour) from model year 1980 to 2017, the fuel economy of vehicles improved 31%. In the 1990s and early 2000s, fuel economy decreased while vehicle weight increased. Fuel economy has improved nearly every year since 2004.

Note: Data are production-weighted averages for each model year and do not represent any individual vehicle. Data for model year 2017 are preliminary. Data include light trucks less than 8,500 lb. Beginning with 2011, SUVs and passenger vans up to 10,000 lb were also included.

Source:

Manufacturers have introduced new technologies that have played a significant role in improving the fuel economy of passenger cars. Turbocharging has enabled manufacturers to downsize engines without sacrificing performance while gasoline direct injection has improved combustion efficiency in the engine. Cylinder deactivation is another strategy for reducing engine displacement that shuts down cylinders under light load conditions. Stop-start reduces unnecessary idling by automatically shutting down the engine when the vehicle is stopped and restarting the engine only when needed. Continuously variable transmissions improve efficiency by maintaining optimum engine speed as the vehicle speed varies. Penetration of direct injection has grown rapidly and was installed on over half of all new cars in 2017. Turbochargers and continuously variable transmissions were each installed on about 30% of new cars produced in 2017.

Source:

^a The Environmental Protection Agency did not record market penetration for this technology in this year.

^b Data for 2017 are preliminary.

Manufacturers have introduced a number of engine and transmission technologies to improve the fuel efficiency and performance of light trucks. Gasoline direct injection has seen rapid market penetration from about 1% of all new light trucks produced in 2008 to nearly half by 2017. Cylinder deactivation, turbocharging, and stop-start have all seen increased penetration with each of these technologies reaching about 20% of production for light trucks in 2017. The penetration of continuously variable transmissions (CVT) is lower for light trucks than for cars because CVTs are not generally well suited to the high horsepower and high torque requirements of pickup trucks and large SUVs that provide greater load hauling and towing capability.

| Model year | Turbo | Continuously variable transmission (non-hybrid) | Continuously variable transmission (hybrid) | Gasoline direct injection | Cylinder deactivation | Stop-start (non-hybrid) | Stop-start (hybrid) |

Source:

^a Loaded vehicle weight is equal to the vehicle's curb weight plus 300 pounds.

^b Data for 2017 are preliminary.

The average light vehicle in 2016 contained more than 2,000 pounds of steel, most of it conventional steel. High and medium strength steel, however, were more than 18% of the vehicle. The use of aluminum grew from 1995 to 2015, while the use of iron castings declined.

^a Data are for vehicles built in North America. Percentages may not sum to totals due to rounding.

In the automotive industry, a tier 1 supplier is a company that sells directly to the original equipment manufacturer (OEM). Globally, Robert Bosch GMbH is the top automotive supplier. Of the top 20 global tier 1 suppliers, only Magna International has more than half its market in North America (56%).

Table 4.22New Light Vehicle Dealerships and Sales, 1970–2017

Source:

Number of dealers - National Automobile Dealers Association website, www.nada.org. (Additional resources: www.nada.org). Light vehicle sales - See tables 4.5 and 4.6.

^b Includes cars and trucks up to 10,000 lb gross vehicle weight.

^a As of the beginning of the year.

In 2010 the number of conventional refueling stations fell below 160,000 for the first time in the series history and continued to decline through 2013. The number of vehicles fueling at those stations fell in 2009 for the first time in several years but began rising slowly in 2011. In 2013, there were 0.61 fueling stations per thousand vehicles or 1.65 thousand vehicles per station.

Table 4.23Conventional Refueling Stations, 1993-2013

Notes: This data series was discontinued after 2013. The County Business Patterns (CBP) data published by the Bureau of the Census tells the number of establishments by North American Industry Classification System (NAICS). NAICS is an industry classification system that groups establishments into industries based on the activities in which they are primarily engaged. NAICS 447 represents gasoline stations. However, the CBP gasoline station data differ from the National Petroleum News Survey data by as much as 30% (117,189 stations in 2005); the CBP may not include every gasoline retail outlet due to the classification of the primary activity of the business.

Alternative Fuel Refueling Stations are listed in Chapter 6.

 Table 4.24

 Fuel Economy and Carbon Dioxide Emissions Standards, MY 2012-2025

Note: The required fuel economy and CO_2 emissions shown here use a model year 2008 baseline. The presented rates of increase in stringency for NHTSA CAFE standards are lower than the Environmental Protection Agency (EPA) rates of increase in stringency for greenhouse gas (GHG) standards. One major difference is that NHTSA's standards, unlike EPA's, do not reflect the inclusion of air conditioning system refrigerant and leakage improvements, but EPA's standards would allow consideration of such improvements which reduce GHGs but generally do not affect fuel economy. The 2025 EPA GHG standard of 163 grams/mile would be equivalent to 54.5 mpg, if the vehicles were to meet this level all through fuel economy improvements. The agencies expect, however, that a portion of these improvements will be made through reductions in air conditioning leakage, which would not contribute to fuel economy.

Federal Register, Vol. 77, No. 199, October 15, 2012. (Additional resources: www.nhtsa.gov/fuel-economy)

The target levels for the fuel economy and carbon dioxide emission standards for vehicles manufactured in model years 2012-on are assigned based on a vehicle's "footprint." Each footprint has a different target. The vehicle footprint is calculated as:

footprint = *track* width × *wheelbase*,

where

track width = *lateral distance between the centerlines of the base tires at ground, and wheelbase* = *longitudinal distance between the front and rear wheel centerlines.*

| | Table 4.25 |
|--------------------------------|--|
| Fuel Economy and Carbon | Dioxide Targets for Model Year 2025 |

| Vehicle type | Example models | Example model footprint (square feet) | CO ₂ emissions target (grams per mile) | Fuel economy target (miles per gallon) |
|--------------------|-----------------|---|---|---|
| | Exa | ample Passenger Cars | | |
| Compact car | Honda Fit | 40 | 131 | 61.1 |
| Midsize car | Ford Fusion | 46 | 147 | 54.9 |
| Fullsize car | Chrysler 300 | 53 | 170 | 48.0 |
| | Exan | nple Light-Duty Truck | s | |
| Small SUV | 4WD Ford Escape | 44 | 170 | 47.5 |
| Midsize crossover | Nissan Murano | 49 | 188 | 43.4 |
| Minivan | Toyota Sienna | 55 | 209 | 39.2 |
| Large pickup truck | Chevy Silverado | 67 | 252 | 33.0 |

Notes: The model year 2025 targets are currently under review. Examples in table use model year 2012 vehicle specifications. The fuel economy from this table will not match the fuel economy listed on the window sticker of a new vehicle. Window sticker fuel economy is calculated by a different methodology than the Corporate Average Fuel Economy.

Federal Register, Vol. 77, No. 199, October 15, 2012. (Additional resources: www.nhtsa.gov/fuel-economy)

The Corporate Average Fuel Economy standards were first established by the U.S. Energy Policy and Conservation Act of 1975 (PL94-163). These standards must be met at the manufacturer level. Legislation passed in December 2007 changed the CAFE standards beginning in the 2011 model year (MY). Some two-wheel drive sport utility vehicles are classified as cars under the final standards for MY 2011-2021.

^a Only vehicles with at least 75 percent domestic content can be counted in the average domestic fuel economy for a manufacturer.

^b Model year as determined by the manufacturer on a vehicle by vehicle basis.

^c All CAFE calculations are sales-weighted.

^d Unreformed standards, which were an option from 2008-2010. See Table 4.24 for reformed standards.

The Corporate Average Fuel Economy standards for light trucks are lower than the car standards. Light trucks include pickups, minivans, sport utility vehicles and vans. New legislation passed in December 2007 changed the CAFE standards beginning in the 2011 model year (MY). Some two-wheel drive sport utility vehicles are classified as cars under the final standards for MY 2011-2021.

^a Only vehicles with at least 75% domestic content can be counted in the average domestic fuel economy for a manufacturer.

^b Represents two- and four-wheel drive trucks combined. Gross vehicle weight of 0-6,000 pounds for model year 1978-1979 and 0-8,500 pounds for subsequent years.

^c Model year as determined by the manufacturer on a vehicle by vehicle basis.

^d All CAFE calculations are sales-weighted.

^f Data are not available.

^g Unreformed standards, which were an option from 2008-2010. See Table 4.24 for reformed standards.

^e Standards were set for two-wheel drive and four-wheel drive light trucks, but no combined standard was set in this year.

Manufacturers of cars and light trucks whose vehicles do not meet the CAFE standards are fined. Data from the National Highway Traffic Safety Administration show the CAFE fine in the year in which the money was collected, which may not be the same year in which it was assessed. A manufacturer can also use CAFE credits to offset fines. Fines for recent model years have not been collected.

 Corporate Average Fuel Economy (CAFE) Fines Collected, as of April 2018^a

Source:

U.S. Department of Transportation, National Highway Traffic Safety Administration, Office of Vehicle Safety Compliance, Washington, DC, December 2014 and updates, April 2018. Data accessed July 13, 2018. (Additional resources: www.nhtsa.gov)

^a These are fines which are actually collected. Fines which are assessed in certain year may not have been collected in that year.

^b Adjusted using the Consumer Price Inflation Index.

Consumers must pay the Gas Guzzler Tax when purchasing a car that has an Environmental Protection Agency (EPA) fuel economy rating (combined city and highway) less than that stipulated in the table below. The Gas Guzzler Tax doubled in 1991 after remaining constant from 1986 to 1990. The tax has not changed since 1991. This tax does not apply to light trucks such as pickups, minivans, sport utility vehicles, and vans.

Table 4.30 (Continued)List of Model Year 2017 Cars with Gas Guzzler Taxes^a

Source:

U.S. Department of Energy and U.S. Environmental Protection Agency, Fuel Economy Guide database, www.fueleconomy.gov

^a Tax is based on unadjusted combined fuel economy; adjusted combined fuel economy is used on window stickers.

The IRS collected \$72.5 million in 2016 from those buying cars with combined city/highway fuel economy less than 22.5 miles per gallon. This tax does not apply to light trucks such as pickups, minivans, sport utility vehicles, and vans. It is worthy to note that total revenue from fines paid by consumers to purchase gas-guzzling vehicles greatly exceeds the overall fines paid by manufacturers whose vehicles fail to meet CAFE standards (see Table 4.26).

^a Adjusted using the Consumer Price Inflation Index.

Autonomie is a system simulation tool for vehicle energy consumption and performance analysis. It is used to evaluate the energy consumption and cost of multiple advanced powertrain technologies. Autonomie was used to develop data on the relationship between steady-state vehicle speed and fuel economy.

 Table 4.32

 Fuel Economy by Speed, Autonomie Model Results

Source:

Argonne National Laboratory, Autonomie model, August 2016, www.autonomie.net. (Additional resources: www.anl.gov/energy/transportation)

The latest study of vehicle fuel economy by speed indicated higher fuel economy around 40 miles per hour, as did the 1973 and 1984 studies. Engineers at Oak Ridge National Laboratory believe that the lowest speed in the vehicle's highest gear is where the best fuel economy is typically obtained. That speed will be different for individual vehicles.

This table shows the driving cycles for the new methodology that the Environmental Protection Agency (EPA) used to determine fuel economy ratings for new vehicles beginning in model year 2008. In addition to the Urban Driving Cycle and the Highway Driving cycle, the EPA will also use three additional tests to adjust fuel economy ratings to account for higher speeds, air conditioner use, and colder temperatures. Though the EPA uses a complex combination of these five cycles to determine the fuel economy that will be posted on a new vehicle window sticker, the manufacturer's Corporate Average Fuel Economy is still calculated using only the city and highway driving cycles. To know more about new vehicle fuel economy ratings, visit www.fueleconomy.gov.

| | Test schedule | | | | | |
|-----------------------------|---|---|--|---|---|--|
| | City | Highway | High speed | Air conditioner (AC) | Cold temp | |
| Trip type | Low speeds in stop-and-go urban traffic | Free-flow traffic at highway speeds | Higher speeds; harder acceleration & braking | AC use under hot ambient conditions | <i>City</i> test w/colder outside temperature | |
| Top speed | 56 mph | 60 mph | 80 mph | 54.8 mph | 56 mph | |
| Average speed | 21 mph | 48 mph | 48 mph | 21 mph | 21 mph | |
| Max. acceleration | 3.3 mph/sec | 3.2 mph/sec | 8.46 mph/sec | 5.1 mph/sec | 3.3 mph/sec | |
| Simulated distance | 11 mi. | 10.3 mi. | 8 mi. | 3.6 mi. | 11 mi. | |
| Time | 31.2 min. | 12.6 min. | 9.9 min. | 9.9 min. | 31.2 min. | |
| Stops | 23 | None | 4 | 5 | 23 | |
| Idling time | 18% of time | None | 7% of time | 19% of time | 18% of time | |
| Engine startup ^a | Cold | Warm | Warm | Warm | Cold | |
| Lab temperature | 68-86° F | 68-86° F | 68-86° F | 95° F | 20° F | |
| Vehicle air conditioning | Off | Off | Off | On | Off | |

Table 4.34Driving Cycle Attributes

Source:

U.S. Department of Energy and U.S. Environmental Protection Agency, Fuel Economy website, www.fueleconomy.gov.

^a A vehicle's engine doesn't reach maximum fuel efficiency until it is warm.

These driving cycles simulate the performance of an engine while driving in the city and on the highway. Once the city cycle is completed, the engine is stopped, and then started again for the 8.5-minute hot start cycle. Three additional cycles also influence new vehicle fuel economy ratings beginning with the 2008 model year.

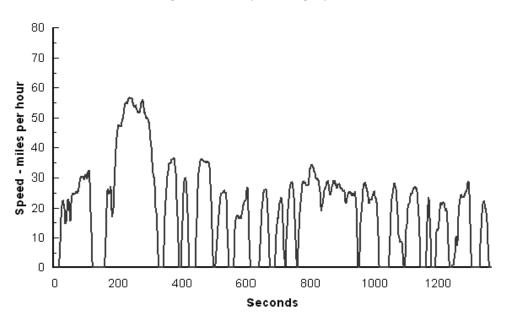

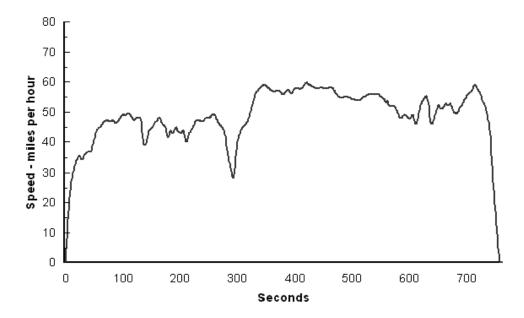

Figure 4.8. City Driving Cycle

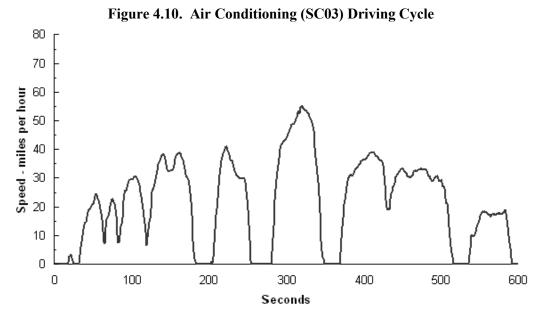

Source:

Code of Federal Regulations, 40CFR, "Subpart B - Fuel Economy Regulations for 1978 and Later Model Year Automobiles - Test Procedures," July 1, 1988 edition, p. 676.

Beginning with the 2008 model year, these cycles influence the new vehicle fuel economy ratings.

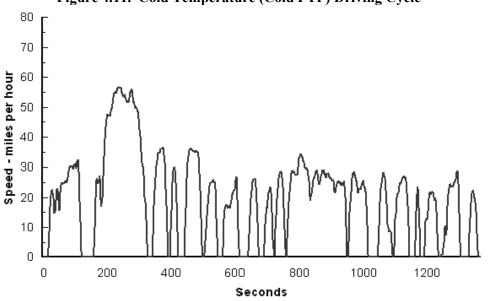

Figure 4.11. Cold Temperature (Cold FTP) Driving Cycle^a

Source:

U.S. Department of Energy and Environmental Protection Agency, Fuel Economy website, www.fueleconomy.gov.

^a Cold FTP uses the same speeds as the city driving cycle. Tests the effects of colder outside temperatures on cold-start driving in stop-and-go traffic.

Beginning with the 2008 model year, this cycle influences the new vehicle fuel economy ratings. The US06 driving cycle was originally developed as a supplement to the Federal Test Procedure. It is a short-duration cycle (600 seconds) which represents hard-acceleration driving.

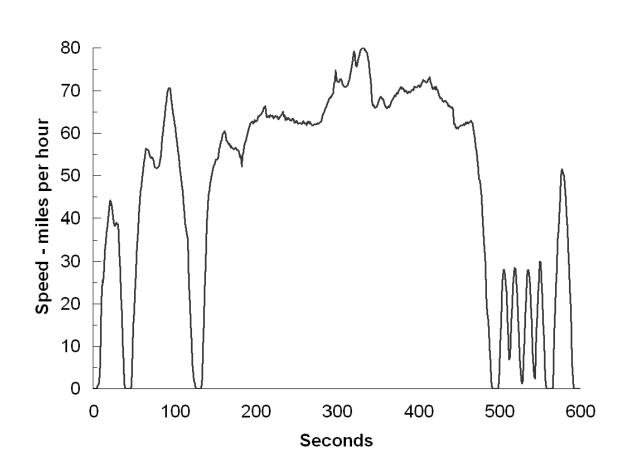

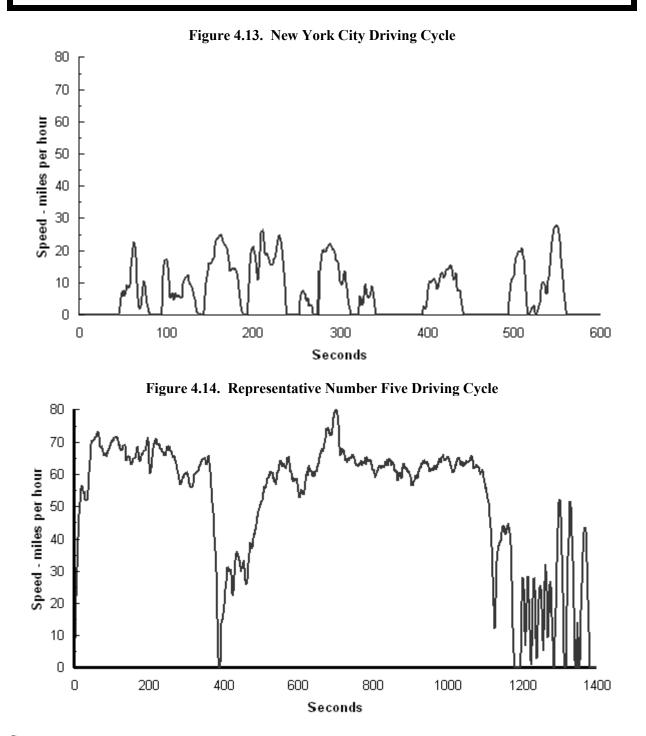

Figure 4.12. High-Speed (US06) Driving Cycle

Two other test cycles are sometimes used by researchers and engineers to test new vehicles (although these do not affect the fuel economy ratings). The New York Test Cycle was developed in the 1970's in order to simulate driving in downtown congested areas. The Representative Number Five Test Cycle was developed in the 1990's to better represent actual on-road driving by combining modern city and freeway driving.

Testing cycles to determine vehicle fuel economy and emissions vary by country. The United States currently uses five different drive cycles to determine vehicle fuel economy. In Europe, the NEDC cycle is being replaced by the WLTC, but the NEDC continues to be used in China. The ARTEMIS cycles are not used in vehicle certification, but are used to represent real world driving in Europe.

| Cycle | Time (seconds) | Distance (miles) | Average Speed (mph) | Maximum Speed (mph) | Maximum Acceleration (mph/s) |
|----------------------------------|-------------------|---------------------|---------------------------|---------------------------|------------------------------------|
| * | Unite | d States | •• / | · · / | |

 Table 4.35

 Comparison of U.S., European, and Japanese Driving Cycles Attributes

Source:

United States - U.S. Department of Energy, Fuel Economy Guide website,

www.fueleconomy.gov/feg/fe_test_schedules.shtml

All other - Compiled from public sources by Aymeric Rousseau, Argonne National Laboratory, September 2016.

Testing cycles to determine vehicle fuel economy and emissions vary by country and therefore it is difficult to make a direct comparison. Simulation results show up to a 28% difference in the test cycles for each vehicle type. Note that the differences in these cycle results also vary with each individual vehicle tested.

| | _ | Miles per gallon | Percentage difference from | | |
|-----------------------|---|---|----------------------------|-----------------|-----------------|
| Vehicle type | U.S. Corporate Average Fuel Economy (CAFE) cycle | New European Driving Cycle (NEDC) | Japan JC08 cycle | CAFE to NEDC | CAFE to JC08 |
| Small car | 34.8 | 32.4 | 27.6 | -7% | -21% |
| Large car | 26.6 | 24.7 | 21.5 | -7% | -19% |
| Minivan | 23.9 | 20.5 | 17.2 | -14% | -28% |
| Sport-utility vehicle | 20.2 | 17.6 | 14.6 | -13% | -28% |
| Pickup | 18.8 | 15.9 | 13.5 | -15% | -28% |

 Table 4.36

 Example of Differing Results Using the U.S., European, and Japanese Driving Cycles

Note: Simulation results for identical gasoline vehicles (i.e., results for the same small car on each of the three cycles).

| Table 5.16 | Tons (millions) | 11,299 |
| Table 5.17 | Ton-miles (billions) | 2,970 |

There are eight truck classes, categorized by the gross vehicle weight rating that the vehicle is assigned when it is manufactured. The pictures below show examples of some of the different body types that would be included in each class. Many of the body types can be in more than one category, depending on the vehicle's attributes. Examples of this include pickups, box trucks, buses, and truck tractors.

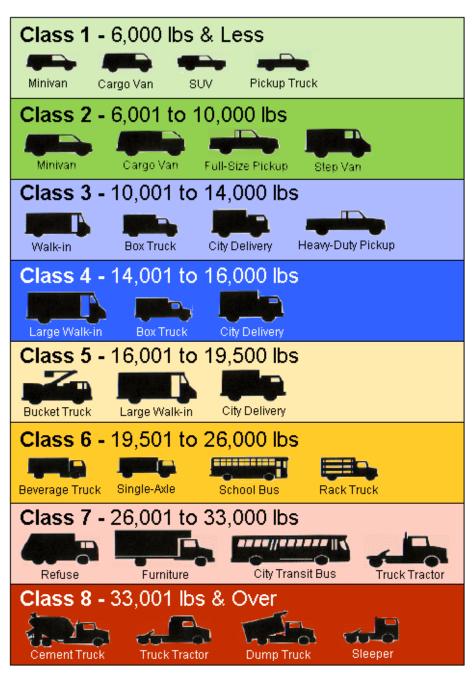

Figure 5.1. Examples of Body Types in Each Truck Class

Source:

Oak Ridge National Laboratory, National Transportation Research Center, Oak Ridge, TN. Gross vehicle weight category definitions from 49CFR565.6 (2000).

Class 3-8 single-unit trucks include trucks over 10,000 lb gross vehicle weight with the cab/engine and cargo space together as one unit. Most of these trucks would be used for business or for individuals with heavy hauling or towing needs. Very heavy single-units, such as concrete mixers and dump trucks, are also in this category. The data series was changed by the FHWA back to 2007.

| Year | Registrations (thousands) | Vehicle travel (million miles) | Average annual miles per vehicle | Fuel use (million gallons) | Average fuel economy per vehicle (miles per gallon) |

 Table 5.1

 Summary Statistics for Class 3-8 Single-Unit Trucks, 1970–2016

Source:

U. S. Department of Transportation, Federal Highway Administration, *Highway Statistics 2016*, Washington, DC, 2017, Table VM-1 and annual. (Additional resources: www.fhwa.dot.gov)

^a Due to FHWA methodology changes, data from 2007-on are not comparable with previous data.

Class 7-8 combination trucks include all trucks designed to be used in combination with one or more trailers with a gross vehicle weight rating over 26,000 lb. The average vehicle travel of these trucks (on a per truck basis) far surpasses the travel of other trucks due to long-haul freight movement. The data series was changed by the FHWA back to 2007.

| Year | Registrations (thousands) | Vehicle travel ^a (million miles) | Average annual miles per vehicle | Fuel use (million gallons) | Average fuel economy per vehicle (miles per gallon) |

^d 1987-2017.

^a Sales include domestic-sponsored imports.

^b Data for 1970 is based on new truck registrations.

^c Data are not available.

Based on factory sales, the share of diesel medium/heavy trucks sold has declined from 1995 to 2017 for truck gross vehicle weight rating (GVWR) classes 4, 5, and 7. Class 6 diesel sales share increased in that period and class 8 continued to be 100% diesel. The result for all class 4 through 8 trucks combined was a decline from 87% diesel share in 1995 to 75% in 2017.

^a Estimates based on available factory sales. May not represent the entire industry.

The Vehicle Inventory and Use Survey (VIUS) was discontinued, thus the 2002 VIUS data remain the latest available.

Vehicle Inventory and Use Survey

The Vehicle Inventory and Use Survey (VIUS), which was formerly the Truck Inventory and Use Survey (TIUS), provides data on the physical and operational characteristics of the Nation's truck population. It is based on a probability sample of private and commercial trucks registered (or licensed) in each state. In 1997, the survey was changed to the Vehicle Inventory and Use Survey due to future possibilities of including additional vehicle types. The 2002 VIUS, however, only includes trucks. Internet site: **www.census.gov/econ/overview/se0501.html**

Since 1987, the survey has included minivans, vans, station wagons on truck chassis, and sport utility vehicles in addition to the bigger trucks. The 1977 and 1982 surveys did not include those vehicle types. The estimated number of trucks that were within the scope of the 2002 VIUS and registered in the United States as of July 1, 2002 was 85.2 million. These trucks were estimated to have been driven a total of 1,115 billion miles during 2002, an increase of 6.8% from 1997. The average annual miles traveled per truck was estimated at 13,100 miles.

The California Department of Transportation is conducting a survey to collect data on the physical and operational characteristics of the State's commercial vehicle population called the California Vehicle Inventory Use and Survey. Internet site:

www.dot.ca.gov/hq/tpp/offices/omsp/statewide_modeling/cal_vehicle_survey.html

| Manufacturer's gross vehicle weight class | Number of trucks | Percentage of trucks | Average annual miles per truck | Harmonic mean fuel economy | Percentage of fuel use |

Estimates are based on data provided on the following public use files: U.S. Department of Commerce, Bureau of the Census, Census of Transportation, Washington, DC, *1992 Truck Inventory and Use Survey*, 1995; *1997 Vehicle Inventory and Use Survey*, 2000, and *2002 Vehicle Inventory and Use Survey*, 2005. (Additional resources: www.census.gov/svsd/www/tiusview.html)

As expected, most light trucks travel within 50 miles of their home base and refuel at public stations. About sixty percent of heavy trucks travel over 50 miles from their home base and 36% of them refuel at central company-owned refueling stations.

^a Percentages may not sum to totals due to rounding.

The figure below shows the distribution of annual travel the two types of Class 7 and 8 vehicles–combination units (separate tractor and trailer) and single units (tractor and trailer on a single chassis). This information is for all trucks and trucks two years old or less. Combination trucks, dominated by box-type trailers, display the greatest amount of annual travel of all heavy vehicle types, as is evidenced both by the range of annual use. Most of the single-unit trucks in the survey travel 40,000 miles per year or less.

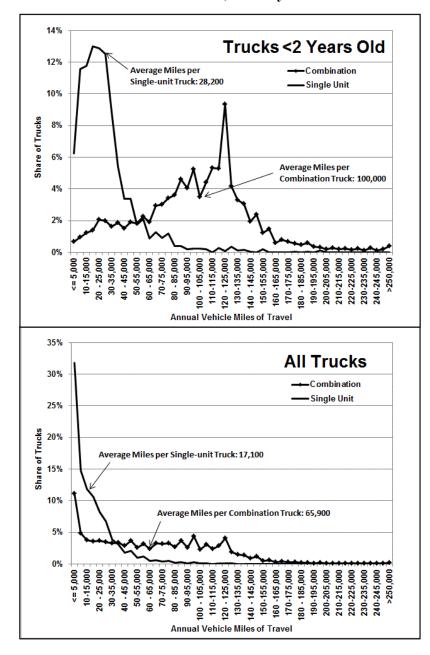

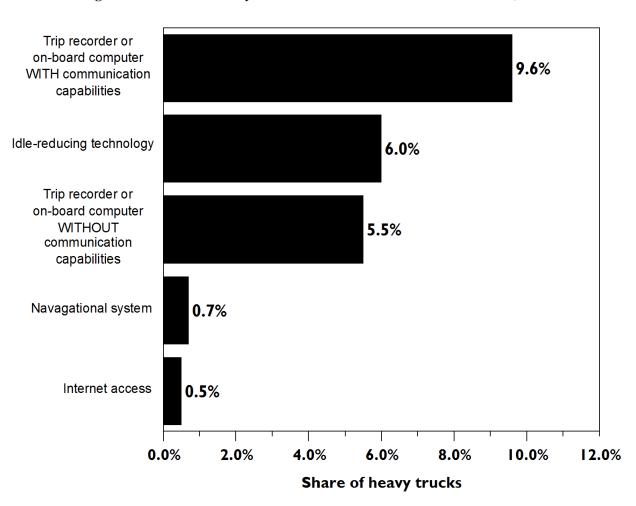

Figure 5.2. Distribution of Trucks over 26,000 lb by Vehicle-Miles Traveled

Note: Heavy trucks (class 7 & 8) are greater than 26,000 pounds gross vehicle weight based on the manufacturer's rating.

Source:

U.S. Department of Commerce, Bureau of the Census, 2002 Vehicle Inventory and Use Survey, Microdata File on CD, 2005. (Additional resources: www.census.gov/svsd/www/tiusview.html)

The latest Vehicle Inventory and Use Survey asked truck owners if the truck had certain features as permanent equipment on the truck. Some of the features asked about were onboard computers, idle-reduction devices, navigational systems, and Internet access. Of the 2.3 million heavy trucks (class 7 & 8) in the United States, nearly 10% were equipped with onboard computers that had communication capabilities and another 5% had onboard computers without communication capabilities. Six percent of heavy trucks were equipped with idle-reducing technology. Navigational systems and Internet access were available in less than one percent of heavy trucks.

Note: Heavy trucks (class 7 & 8) are greater than 26,000 pounds gross vehicle weight based on the manufacturer's rating.

Fuel Economy Study for Class 8 Trucks

As part of a study sponsored by the U.S. Department of Energy (DOE) Vehicle Technologies Office (VTO), the Oak Ridge National Laboratory (ORNL) in conjunction with several industry partners has collected data and information related to heavy-truck operation in real-world highway environments. The primary objective of the project was to collect real-world performance and spatial data for long-haul operations of Class 8 tractor-trailers from a fleet engaged in normal freight operations. Six model-year 2005 Class 8 trucks from the selected fleet, which operates within a large area of the country extending from the east coast to Mountain Time Zone and from Canada to the US-Mexican border, were instrumented and 60 channels of data were collected for over a year at a rate of 5 Hz (or 5 readings per second). Those channels included information such as instantaneous fuel rate, engine speed, gear ratio, vehicle speed, and other information read from the vehicle's databus; weather information (wind speed, precipitation, air temperature, etc.) gathered from an on-board weather station; spatial information (latitude, longitude, altitude) acquired from a GPS (Global Positioning System) device; and instantaneous tractor and trailer weight obtained from devices mounted on the six participating tractors and ten trailers. Three of the six instrumented tractors and five of the ten instrumented trailers were mounted with New Generation Single Wide-Based Tires and the others with regular dual tires. Over the duration of this phase of the project (just over a year) the six tractors traveled nearly 700,000 miles.

To find out more about this project, contact Oscar Franzese, franzeseo@ornl.gov, 865-946-1304. The final report on this project is available on-line at: cta.ornl.gov/cta/Publications/Reports/ORNL TM 2008-122.pdf. The type of terrain a truck is traveling on can cause significant differences in fuel efficiency. This study (see page 5-15 for project description) shows fuel economy on severe upslopes is less than half that on flat terrain. On severe downslopes, the fuel economy was two times higher than on flat terrain.

| | | Average fuel efficiency (mpg) | | | | | | |
|-----------------------------|---------------|-------------------------------|-----------|--------------|-----------------|--|--|--|
| | | | | | Difference | | | |
| | | | Tractors | Tractors | between dual | | | |
| | Share of data | All | with dual | with single | and single | | | |
| Type of terrain | records | trucks | tires | (wide) tires | tires (percent) | | | |
| Severe upslope (>4%) | 0.7% | 2.90 | 2.86 | 2.94 | 2.91% | | | |
| Mild upslope (1% to 4%) | 13.2% | 4.35 | 4.25 | 4.44 | 4.35% | | | |
| Flat terrain (1% to 1%) | 72.4% | 7.33 | 7.08 | 7.58 | 7.13% | | | |
| Mild downslope (-4% to -1%) | 12.6% | 15.11 | 14.64 | 15.57 | 6.36% | | | |
| Severe downslope (<-4%) | 1.1% | 23.5 | 21.82 | 25.3 | 15.97% | | | |

Table 5.11Effect of Terrain on Class 8 Truck Fuel Economy

Source:

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. *Class-8 Heavy Truck Duty Cycle Project Final Report*, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008. (Additional resources: cta.ornl.gov/cta/Publications/Reports/ORNL_TM_2008-122.pdf)

This table presents a distribution of distance traveled, fuel consumed, and fuel economy by speed and by type of tires for the vehicles participating in the project (see page 5-15 for project description). The speed bins are divided into 5-mile intervals, going from 0+ mph (i.e., speed > 0.00 mph) to 85 mph, while the four main columns of the table are organized by the type of tires that were mounted on the tractor and trailers. The first row of the table contains information about fuel consumed while the vehicle was idling (i.e., the vehicle was static with the engine on) with the following rows presenting information about the distance traveled, fuel consumed, and fuel economy for each one of the speed intervals. The next-to-the-last row shows the totals for both traveled distances and fuel consumed as well as the overall fuel economy for each tire-combination category. The latter are then used to compute the percentage difference in terms of fuel economy from dual tire tractors and trailers, which is the most common tire setup for large trucks at the present time.

Table 5.12 Fuel Economy for Class 8 Trucks as Function of Speed and Tractor-Trailer Tire Combination

Note: These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. Class-8 Heavy Truck Duty Cycle Project Final Report, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008. (Additional resources: cta.ornl.gov/cta/Publications/Reports/ORNL_TM_2008-122.pdf)

^a Total fuel consumed does not include fuel consumed while idling.

The fuel economy information presented in Table 5.12 is on the upper limits of today's large-truck fleets and is mostly a result of driver training and the extensive vehicle maintenance (including constant tire pressure) to which the fleet company participating in this project adheres. Nevertheless, the results of this extensive test indicate that there are substantial gains in terms of fuel economy for large trucks when single (wide) tires are used in combination with dual tires or alone (best case). Figure 5.4 shows the information from Table 5.12 in a graphical form (bars) and also displays for each speed bin the percentage of the total distance that is traveled at that speed (line). It is possible to observe that above 80% of the distance traveled by long-haul Class 8 trucks is done at speeds above 55 mph. Therefore, any gains in fuel economy of these types of trucks. Figure 5.4 shows that, except for the D-S combination within the 65+ to 70 mph, the combinations with all single (wide) tires perform better and, therefore, obtain the largest overall fuel economy.

Figure 5.4. Class 8 Truck Fuel Economy as a Function of Speed and Tractor-Trailer Tire Combination and Percentage of Total Distance Traveled as a Function of Speed

NOT ADJUSTED FOR TERRAIN: See note below.

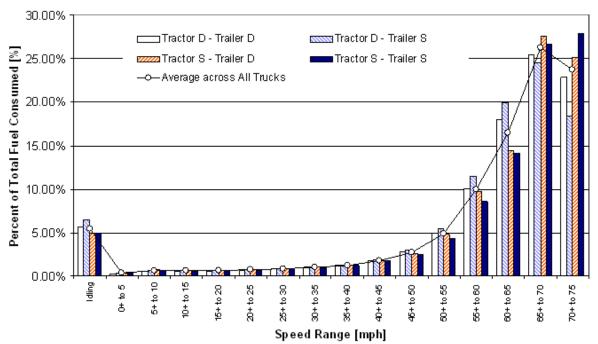

Note: D = Dual tire. S = Single (wide) tire.

These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

Source:

Capps, Gary, Oscar Franzese, Bill Knee, M.B. Lascurain, and Pedro Otaduy. Class-8 Heavy Truck Duty Cycle Project Final Report, ORNL/TM-2008/122, Oak Ridge National Laboratory, Oak Ridge, TN, December 2008. (Additional resources: cta.ornl.gov/cta/Publications/Reports/ORNL_TM_2008-122.pdf) This graph presents for each one of the four tire-combination categories the percent of total fuel that is consumed when traveling at different speeds (bars) as well as the average percent of fuel consumed for each speed bin (line). As opposed to Table 5.12, the total fuel consumed on this graph includes the fuel consumed while idling.

NOT ADJUSTED FOR TERRAIN: See note below

Note: D = Dual tire. S = Single (wide) tire.

These data were not adjusted to account for the effects of terrain. The increase in fuel economy for speeds above 70 mph is likely due to the vehicle achieving high speeds while traveling down slope. Therefore, this increase in fuel economy is not expected to be characteristic of all travel at these higher speeds.

National Academy of Sciences, Technologies and Approaches to Reducing the Fuel Consumption of Medium and Heavy-Duty Vehicles, 2010, p. 117.

The gross weight of a vehicle (GVW) is the weight of the empty vehicle plus the weight of the maximum payload that the vehicle was designed to carry. In cars and small light trucks, the difference between the empty weight of the vehicle and the GVW is not significantly different (1,000 to 1,500 lb). The largest trucks and tractor-trailers, however, have a payload capacity share of 200%, which means they can carry 200% of their empty weight. The medium-sized trucks (truck classes 3-6) have payload capacity shares between 50% and 100%.

| | | | | Maximum | Payload |

 Table 5.14

 Gross Vehicle Weight vs. Empty Vehicle Weight

Source:

National Academy of Sciences, *Technologies and Approaches to Reducing the Fuel Consumption of Medium and Heavy-Duty Vehicles*, 2010, pp. 18 and 116.

According to weigh-in-motion data collected by fifteen states, the majority of 5-axle tractor-trailers on the road weigh between 33,000 and 73,000 lb. Eleven percent of the tractor-trailers had weight recorded around 72,800 lb and 10% around 68,300 lb. Another 10% of tractor-trailers were on the lighter end of the scale – around 37,500 lb. These data show that only a small percent of trucks on the road are near the maximum roadway gross vehicle weight of 80,000 lb. Thus, most trucks are filling the trailer space to capacity (cubing-out) before they reach the maximum weight limit (weighing-out).

^a Study reported data on 5-axle tractor-trailers which are class 8 trucks. Single-unit class 8 trucks were not considered in the study.

Commodity Flow Survey

The Commodity Flow Survey (CFS) designed to provide data on the flow of goods and materials by mode of transport. The survey was first conducted in various years from 1963 to 1977, and was again conducted in 1993, 1997, 2002, 2007, and 2012 with improvements in methodology, sample size, and scope. Data collection for the 2017 survey began in late 2016 and preliminary data are expected in December 2018. It is a shipper-based survey which covers business establishments from these industries:

- Mining
- Manufacturing
- Wholesale trade
- Select Retail and Services

Industries not covered by CFS include transportation, construction, most retail and services industries, farms, fisheries, foreign establishments, and most government-owned establishments. Before 1993 data were collected only on the principal mode of travel, but after that time all modes of a shipment were captured in the data.

The CFS is a joint effort of the Bureau of Transportation Statistics and the U.S. Census Bureau. Additional information on the survey can be found at:

www.bts.gov/content/commodity-flow-survey-overview www.census.gov/programs-surveys/cfs.html Industries covered by the 2012 Commodity Flow Survey (CFS) shipped goods worth over \$13 trillion. Compared to the 1993 CFS, the value of shipments is up 1.7% per year and tons shipped are up 0.8% per year. By value, multiple mode shipments increased 2.8% per year from 1993 to 2012.

Ranging from a speed limit of 55 miles per hour (mph) to 85 mph, the maximum speed limit for trucks varies from state to state and sometimes from year to year. Currently, California has the most conservative maximum speed limit for trucks – 55 mph. At the other end of the spectrum, Texas has some roads where the truck speed limit is 85 mph. Because of the varying limits, there is not one common highway speed at which trucks travel. This precludes truck manufacturers from engineering truck engines that peak in efficiency after reaching the speed at which the vehicles most commonly travel. Instead, manufacturers design the vehicle to perform well over the entire range of speeds.

Insurance Institute for Highway Safety, Highway Loss Data Institute, "Speed Limits," September 2018. (Additional resources: www.iihs.org/iihs/topics/laws/speedlimits)

Although all states allow the conventional combinations consisting of a 28-foot semi-trailer and a 28-foot trailer, only 14 states and six state turnpike authorities allow longer combination vehicles (LCVs) on at least some parts of their road networks. LCVs are tractors pulling a semi-trailer and trailer, with at least one of them – the semi-trailer, the trailer, or both – longer than 28 feet. The routes that these LCVs can travel have not changed since 1991.

Note: Empty triples are allowed on I-80 in Nebraska.

U.S. Department of Transportation, Bureau of Transportation Statistics, *Freight Facts and Figures 2017*, 2018. (Additional resources: www.bts.gov/product/freight-facts-and-figures).

The U.S. Department of Transportation mandates that truckers rest for 10 hours after driving for 11 hours, during which time they often park at truck stops idling the engines to provide heating, cooling and use of electrical appliances. Electrification at truck stops allows truckers to "plug-in" vehicles to operate the necessary systems without idling the engine. There are currently 103 publicly accessible electrification sites across the nation. Some of these sites require special equipment to be installed on the truck and others do not.

| | Electric outlets | 58,634 |
| | LPG | 3,357 |
| | CNG | 1,664 |
| | Biodiesel | 704 |
| | Hydrogen | 60 |

| Fuel type ab | obrev | viations are used throughout this chapter. |
|--------------|-------|--|
| B20 | = | 20% biodiesel, 80% petroleum diesel |
| CNG | = | compressed natural gas |
| E85 | = | 85% ethanol, 15% gasoline |
| E95 | = | 95% ethanol, 5% gasoline |
| H_2 | = | hydrogen |
| LNG | = | liquefied natural gas |
| LPG | = | liquefied petroleum gas |
| | | |

The Energy Policy Act of 1992 defines alternative fuels and allows the U.S. Department of Energy (DOE) to add to the list of alternative fuels if the fuel is substantially nonpetroleum, yields substantial energy security benefits, and offers substantial environmental benefits. DOE currently recognizes the following as alternative fuels:

- methanol, ethanol, and other alcohols,
- blends of 85% or more of alcohol with gasoline,
- natural gas and liquid fuels domestically produced from natural gas,
- liquefied petroleum gas (propane),
- coal-derived liquid fuels,
- hydrogen,
- electricity,
- biodiesel (B100),
- fuels (other than alcohol) derived from biological materials,
- P-series.

Alternative Fuels Data Center

DOE established the Alternative Fuels Data Center (AFDC) in 1991 to support its work aimed at fulfilling the Alternative Motor Fuels Act directives. Since then, the AFDC has expanded its focus to include all advanced transportation fuels, vehicles, and technologies. The AFDC is operated and managed by the National Renewable Energy Laboratory (NREL) in Golden, Colorado.

The purposes of the AFDC are:

- to gather and analyze information on the fuel consumption, emissions, operation, and durability of alternative fuel vehicles, and
- to provide unbiased, accurate information on alternative fuels and alternative fuel vehicles to government agencies, private industry, research institutions, and other interested organizations.

Much of the AFDC data can be obtained through their website: **www.afdc.energy.gov**. Several tables and graphs in this chapter contain statistics which were generated by the AFDC. Below are some links to specific areas of the AFDC website.

Alternative & Advanced Fuels – www.afdc.energy.gov Alternative Fueling Station Locator – www.afdc.energy.gov/afdc/locator/stations Alternative & Advanced Vehicles – www.afdc.energy.gov/fuels State & Federal Incentives & Laws – www.afdc.energy.gov/afdc/laws Data Analysis & Trends – www.afdc.energy.gov/data Tools – www.afdc.energy.gov/tools The Energy Information Administration (EIA) is no longer publishing estimates of the number of alternative vehicles in use in the United States. EIA does publish the number of alternative fuel vehicles "made available" each year, beginning in 2004. The alternative fuel vehicles "made available" are estimates from vehicle manufacturer production and companies performing vehicle conversions. The data are more of a proxy for alternative fuel vehicle sales than for vehicle population, but EIA cautions that the data are not actual sales data.

Table 6.2Hybrid and Plug-In Vehicle Sales, 1999-2017

Note: Plug-in vehicle sales include only those vehicles certified for highway use. Small electric carts and neighborhood electric vehicles are excluded.

Sources:

Hybrid and Electric Vehicle Sales – Compiled by the Transportation Research Center at Argonne National Laboratory, 2018. (Additional resources: www.anl.gov/energy-systems/project/light-duty-electric-drive-vehicles-monthly-sales-updates)

All Light Vehicle Sales – Table 3.11.

^a Includes plug-in hybrid-electric vehicles and all-electric vehicles.

^b Includes cars and trucks up to 10,000 lb gross vehicle weight.

Trolleybus, heavy rail, and light rail use nearly all alternative fuels. However, the 54.3% of buses using alternative fuels replace a lot of traditional fuel use. Ferry boats have the highest average age.

| | Average | Percent powered by | Number of |
|---------------------------------------|---------|-----------------------|--------------|
| Mode | age | alternative fuels | vehicles |
| Bus ^a | 7.6 | 54.3% | 72,075 |
| Commuter rail locomotive ^b | 19.0 | 4.4% | 7,216 |
| Commuter rail self-propelled car | 20.5 | 67.9% | с |
| Ferry Boat | 26.4 | с | 201 |
| Heavy Rail ^d | 20.0 | 100.0% | 10,737 |
| Light Rail ^e | 20.5 | 100.0% | 2,083 |
| Demand Response | 4.2 | 19.5% | 71,299 |
| Trolleybus | 10.6 | 100.0% | 611 |
| Vanpool | с | 32.1% | 13,487 |

Table 6.3 Alternative Fuel Transit Vehicles, 2016

Note: See Glossary for definition of modes, such as paratransit and vanpool. The number of vehicles are 2015 data.

^b Electric car or diesel-propelled railway for urban passenger train service between a central city and adjacent suburbs.

° Data are not available.

^d An electric railway with the capacity for a heavy volume of traffic.

^c Typically an electric railway with a light volume traffic capacity with power drawn from an overhead electric line.

^a Includes bus rapid transit and commuter bus vehicles.

Table 6.4E85 Flex-Fuel Vehicles Available by Manufacturer, Model Year 2018

Note: EV = electric vehicle; PHEV = plug-in hybrid-electric vehicle; FCEV = hydrogen fuel cell vehicle. For PHEV Range, the term "Elec" refers to the charge depleting portion of operation where electricity is exclusively or primarily used.

Source:

U.S. Department of Energy and U.S. Environmental Protection Agency, Fuel Economy Website, Power Search www.fueleconomy.gov/feg/powerSearch.jsp. Data accessed: May 9, 2018.

In 1991 there were only two alternative fuel vehicle (AFV) models on the market which were fueled by M85. In 2018 there were 128 different models of AFV on the market, with 44% of those are electric vehicles which include plug-in hybrid-electric vehicles. Another 42% of the models available in 2018 were fueled by E85.

www.afdc.energy.gov/afdc/fuels/stations_counts.html, August 2018. (Additional resources: www.afdc.energy.gov)

^a Totals by State is the total number of fuel types available at stations. Stations are counted once for each type of fuel available. For electric, the number of charging outlets was used.

There were just over 3,000 propane stations in the United States in 1992 making up 89% of all alternative refueling stations. Electric vehicle stations, which after 2011 are counted by the number of plugs rather than by the geographic location, have the largest number of stations in 2018.

| Year | Propane | CNG | LNG | Biodieselª | Ethanol (E85) | Methanol (M85) | Electric vehicle ^b | Hydrogen | Total |

Table 6.12 Number of Alternative Refuel Stations, 1992–2018 (number of stations)

Source:

U.S. Department of Energy, Alternative Fuels Data Center website, "U.S. Alternative Fueling Stations by Fuel Type," www.afdc.energy.gov/data/10332. (Additional resources: www.afdc.energy.gov)

^a Stations selling biodiesel blends less than B20 are included in the station count for years 2005-2007 only.

^b Starting in 2011, electric stations are counted by the plug rather than by the geographical location. This is different from the other fuels, which count only the geographical location regardless of how many dispensers or nozzles are on site.

^c For each year, data for this table were gathered as close to September 30 as possible. Data for Table 6.11 were gathered in August and do not match these 2018 data.

^d Data are not available.

^e Because data are not comparable from 2008 to 2018, an average annual percentage change is not provided.

Clean Cities is a locally-based government/industry partnership, coordinated by the U.S. Department of Energy to expand the use of alternatives to gasoline and diesel fuel. By combining the decision-making with voluntary action by partners, the "grass-roots" approach of Clean Cities departs from traditional "top-down" Federal programs.

U.S. Department of Energy, Alternative Fuels Data Center website, "Fuel Properties Comparison," www.afdc.energy.gov/fuels/fuel_comparison_chart.pdf, July 2015, and communication with George Mitchell, National Renewable Energy Laboratory, July 2015.

^a Standard Chemical Formulas represent idealized fuels.

^b CNG: 1 Gasoline Gallon Equivalent = 5.66 lb. (as referenced by NIST Special Publication 854; Report of the 78th NCWM (1993); p. 326; NG data derived from field sampling of pipeline natural gas by IGT/GRI).

Chapter 7 Fleet Vehicles and Characteristics

Summary Statistics from Tables in this Chapter

| Source | | |
|------------|---|-----------|
| Figure 7.1 | Fleet cars, 2017 | 3,836,000 |
| Figure 7.1 | Fleet trucks \leq 19,500 lbs. GVW, 2017 | 4,726,000 |
| Table 7.3 | Average annual miles per commercial fleet vehicle, 2016 | |
| | SUVs | 20,232 |
| | Intermediate cars | 19,752 |
| | Pickup trucks | 16,728 |
| Figure 7.2 | Average annual miles per Federal Government fleet vehicle, 2015 (latest available data) | |
| | Sedans | 9,855 |
| | SUVs | 9,508 |
| | Buses | 8,256 |
| | Heavy trucks | 6,730 |
| | Medium trucks | 6,600 |
| | Light trucks | 6,245 |
| | Ambulances | 5,403 |
| Table 7.4 | Federal government vehicles, FY 2015 (latest available data) | 640,304 |
| | Light trucks (<8,500 lbs. GVW) | 281,993 |
| | Cars and other passenger vehicles | 235,319 |
| | Medium trucks (8,500–26,000 lbs. GVW) | 79,421 |
| | Heavy trucks (>26,000 lbs. GVW) | 34,049 |
| | Buses and ambulances | 9,522 |

Vehicles in fleets of 15 or more are counted as fleet vehicles, as well as vehicles in fleets where five or more vehicles are purchased annually. There are more trucks in fleets than cars in 2017.

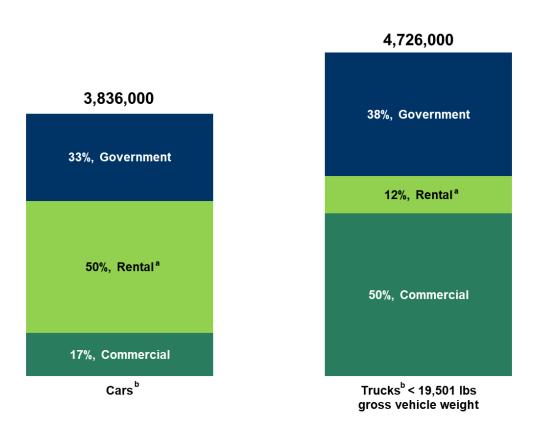

Figure 7.1. Fleet Vehicles in Service as of January 1, 2017

Source:

Bobit Publishing Company, Automotive Fleet Research Department, Automotive Fleet Factbook 2017, Redondo Beach, CA, 2018.

^a Rental category includes vans and sports utility vehicles under cars, not trucks.

^b Fleets of 15 or more in operation or 5 or more fleet vehicles purchased annually. Taxi and police fleet data are not available.

Data for fleet vehicles (cars and trucks less than 19,501 pounds) show that rental fleets are the largest share of cars and commercial fleets are the largest share of trucks. Government fleets are the second largest share for both cars and trucks.

| Year | Commercial | Rental ^a | Government | Police & Taxi ^b | Total |

Table 7.1 Fleet Vehicles in Service, 2006-2017 (thousands of vehicles)

Source:

Bobit Publishing Company, Automotive Fleet Research Department, *Automotive Fleet Factbook 2017*, and annual, Redondo Beach, CA, 2018. (Additional resources: www.fleet-central.com)

^a Rental category includes vans and sports utility vehicles under cars, not trucks.

^b Taxi category includes vans.

[°] Fleets of 15 or more in operation or 5 or more fleet vehicles purchased annually.

^d Data are not available.

In commercial fleets, full size vans stay in service the longest—an average of 60 months. Commercial fleet vehicles average about 19,000 miles in a year.

These data, which apply to domestic Federal fleet vehicles, indicate that sedans now have the highest average annual miles per vehicle, followed closely by sport utility vehicles (SUVs).

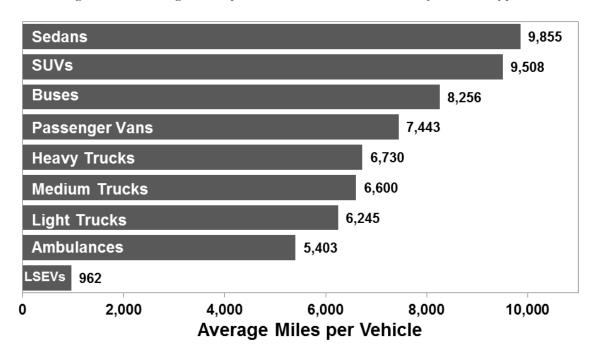

Figure 7.2. Average Miles per Domestic Federal Vehicle by Vehicle Type, 2015

Note: Light trucks = less than 8,500 pounds gross vehicle weight ratio (GVWR).

Medium trucks = 8,501-23,999 pounds GVWR.

Heavy trucks = 24,000 pounds GVWR or more.

LSEVs = low-speed electric vehicles.

Source:

U.S. General Services Administration, Federal Vehicle Policy Division, *FY 2015 Federal Fleet Report*, Washington, DC, 2016, Table 4-2. (Additional resources: www.gsa.gov)

The Federal Government vehicle inventory includes 20% more light trucks than passenger vehicles.

Demand response vehicles (also called paratransit or dial-a-ride) are widely used by transit agencies. The vehicles do not operate over a fixed route or on a fixed schedule. The vehicle may be dispatched to pick up several passengers at different pick-up points before taking them to their respective destinations and may even be interrupted en route to these destinations to pick up other passengers. Demand response service is provided primarily by vans. In 2007, the data changed substantially due to improved estimation methodologies. Unfortunately, those data are no longer comparable to the rest of the historical series.

^a Estimates as of July 1. Includes Armed Forces in the United States.

In 2016, vehicles per capita reached a new high of 0.837. Vehicle-miles per capita were over 10,000 miles from 2004 to 2007 but were 9,916 miles in 2016. There were 1.787 vehicles for every employed civilian in the United States in 2016.

^a Includes all vehicles (light and heavy).

^b Data are not available.

Household vehicle ownership shows a dramatic increase from 1960 to 1990. In 1960, nearly 79% of households owned less than two vehicles; by 1990, it declined to 45%. Census data prior to 1990 indicated that the majority of households owned one vehicle; in 1990 that changed to two vehicles. Since 2000, less than 10% of households had no vehicles. The share of households with three or more vehicles has risen each year since 2011. The American Community Survey now collects these data on an annual basis, thus annual data are available after 2010.

2017 National Household Travel Survey Daily Trip Data

The Department of Transportation (DOT) collected data on daily trips in 1969, 1977, 1983, 1990 and 1995 via the Nationwide Personal Transportation Survey (NPTS). For 2001, the DOT combined the collection of long trip and daily trip data into one survey – the 2001 National Household Travel Survey (NHTS). The long trip data were not included in the 2009 or 2017 NHTS.

The NHTS is the nation's inventory of daily travel. The survey includes demographic characteristics of households, people, vehicles, and detailed information on daily travel for all purposes by all modes. NHTS survey data are collected from a sample of U.S. households and expanded to provide national estimates of trips and miles by travel mode, trip purpose, and a host of household attributes.

The NHTS was designed to continue the NPTS series, but as with all data surveys, caution should be used when comparing statistics from one survey to another due to changes in terminology, survey procedures, and target population. The NHTS surveys collected data on trips of children under 5 years of age, while the previous NPTS did not. Improved methodologies first used in the collection of trip information in the 1995 NPTS make it difficult to compare these data with past NPTS survey data. Thus, the 1990 NPTS trip data have been adjusted to make it comparable with the later surveys.

In the 2017 survey, households were able to respond online as well as by phone. The online survey included a mapping feature that allowed more accurate trip distances to be collected. These derived trip distances appear to be about 10% shorter than self-reported trips.

A vehicle trip in the NHTS is defined as a one-way trip by a single privately-operated vehicle regardless of the number of persons in the vehicle. A person trip is defined as a movement in the public space between two identifiable points. Two household members traveling together in one car would be counted as two person trips and one vehicle trip. Trips made in other highway vehicles, such as buses, streetcars, taxis (including Uber/Lyft), and school buses are collected in the NHTS, but these are shown as person trips by those modes because there is no way to trace movement of those vehicles throughout the day.

Table 8.5 Demographic Statistics from the 1969, 1977, 1983, 1990, 1995 NPTS and 2001, 2009, 2017 NHTS

| | 1969 | 1977 | 1983 | 1990 | 1995 | 2001 | 2009 | 2017 | Percent change 1969–2017 |
|-------------------------------------|------|------|------|------|------|------|------|------|--------------------------------|
| Persons per household | 3.16 | 2.83 | 2.69 | 2.56 | 2.63 | 2.58 | 2.50 | 2.55 | -19% |
| Vehicles per household | 1.16 | 1.59 | 1.68 | 1.77 | 1.78 | 1.89 | 1.87 | 1.87 | 61% |
| Workers per household | 1.21 | 1.23 | 1.21 | 1.27 | 1.33 | 1.35 | 1.34 | 1.33 | 10% |
| Licensed drivers per household | 1.65 | 1.69 | 1.72 | 1.75 | 1.78 | 1.77 | 1.88 | 1.89 | 14% |
| Vehicles per worker | 0.96 | 1.29 | 1.39 | 1.40 | 1.34 | 1.39 | 1.40 | 1.41 | 47% |
| Vehicles per licensed driver | 0.70 | 0.94 | 0.98 | 1.01 | 1.00 | 1.06 | 1.00 | 0.99 | 42% |
| Average vehicle trip length (miles) | 8.89 | 8.34 | 7.90 | 8.98 | 9.06 | 9.87 | 9.72 | 9.55 | 7% |

Note: Average vehicle trip length for 1990 and 1995 is calculated using only those records with trip mileage information present. The 1969 survey does not include pickups and other light trucks as household vehicles. Data on vehicles per household and licensed drivers per household will not match Table 8.2 and 8.3 because they come from a different source.

Sources:

U.S. Department of Transportation, Federal Highway Administration, 1990 Nationwide Personal Transportation Survey: Summary of Travel Trends, FHWA-PL-92-027, Washington, DC, March 1992, Table 2. Data for 1995, 2001, 2009, and 2017 were generated from the 2017 National Household Travel Survey website nhts.ornl.gov. (Additional resources: www.fhwa.dot.gov) Due to methodology improvements in collecting trip information, the 2001 and 1995 data should be compared only to the 1990 adjusted data. The original 1990 data are comparable to all previous surveys; however, comparisons should always be made with caution because of differing survey methodologies.

U.S. Department of Transportation, Federal Highway Administration, 1990 Nationwide Personal Transportation Survey: Summary of Travel Trends, FHWA-PL-92-027, Washington, DC, March 1992, Table 7. 1990 adjusted data – Oak Ridge National Laboratory, Oak Ridge, TN, August 1998. 1995 NPTS, 2001, 2009, 2017 NHTS data were generated from the 2017 National Household Travel Survey website nhts.ornl.gov. (Additional resources: www.fhwa.dot.gov, nhts.ornl.gov)

^a It is believed that the methodology changes in the 1995 NPTS did not affect journey-to-work trips; therefore, no adjustment is necessary.

The number of drivers in a household makes a difference in vehicle miles of travel (vmt), as does the presence of children in the household. Households with children have 64% more vmt than households without children in 2017. Rural households have more vehicles, on average, than urban households.

^a Average vehicle-miles traveled per household is the total movement in miles of all privately operated vehicles, regardless of the number of people in the vehicle, divided by the total number of households in the survey.

In 2017, 24% of vehicle trips were traveling to and from work. Another 20% of trips were for shopping which is down slightly from 2001. Shopping is done close to home, as the average trip length for shopping was only seven miles.

| | Share | of trips | Share of miles tr | | Trip le (mil | - | Trip le (minu | U |

^a Percentages may not sum to totals due to rounding.

Overall, household vehicle occupancy remained the same in 2017 as in 2009. Sport utility vehicle occupancy declined from 1.90 to 1.83 from 2009 to 2017, while pickup truck occupancy stayed the same. Car occupancy was nearly the same in those years as well.

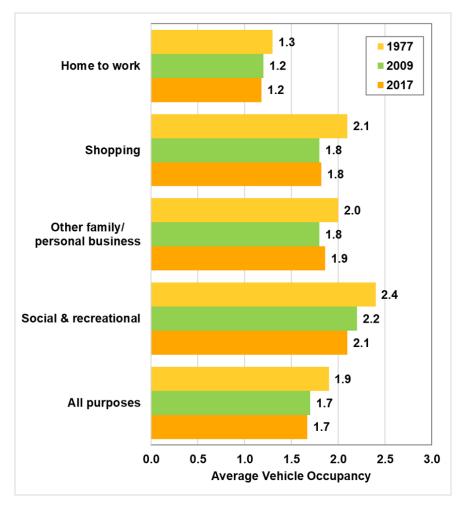

Note: Average vehicle occupancy is mileage-weighted and only includes privately operated household vehicles.

Sources:

Generated from the Department of Transportation, Federal Highway Administration, Nationwide Personal Transportation Survey Public Use Files, Washington, DC, 2000 and the 2017 National Household Travel Survey website nhts.ornl.gov. (Additional resources: nhts.ornl.gov)

The average vehicle occupancy, calculated as person-miles per vehicle-mile, is highest for social and recreational purposes. The highest vehicle occupancy levels for all purposes were in 1977. The increase in number of vehicles per household and the decrease in average household size could have contributed to the decline since then.

Note: Average vehicle occupancy is mileage-weighted and only includes privately operated household vehicles. The "All purposes" category includes other purposes not shown above, such as trips to school, church, doctor, dentist, and work-related business.

Sources:

U.S. Department of Transportation, Federal Highway Administration, 1990 Nationwide Personal Transportation Survey: Summary of Travel Trends, FHWA-PL-92027, Washington, DC, March 1992, Figure 6. Data from 2009 and 2017 NHTS were generated from the 2017 National Household Travel Survey website nhts.ornl.gov. (Additional resources: www.fhwa.dot.gov, nhts.ornl.gov) The 1990 household survey reports the highest average annual miles per vehicle and the 2017 survey reports the lowest. These data show that younger vehicles are typically driven more miles than older vehicles.

| Vehicle age | 1983 | 1990 | 1995 | 2001 | 2009 | 2017 |

 Nationwide Personal Transportation Study—1983: D. Klinger and J. Richard Kuzmyak, COMSIS Corporation, *Personal Travel in the United States, Volume 1: 1983–84 Nationwide Personal Travel Study*, prepared for the U.S. Department of Transportation, Washington, DC, August 1986, Table 4-22, p. 4-21. 1990: Generated from the *1990 Nationwide Personal Transportation Study Public Use Tape*, March 1992. 1995, 2001, 2009, and 2017: Generated from the 2017 National Household Travel Survey website nhts.ornl.gov. (Additional resources: nhts.ornl.gov) Historically, the data from the Nationwide Personal Transportation Survey (NPTS) are based on estimates reported by survey respondents. For the 1995 NPTS and the 2001 National Household Travel Survey (NHTS), odometer data were also collected. The 1995 data indicate that respondents overestimate the number of miles they drive in a year, but the 2001 data do not show that same trend.

| Vehicle age | 1995 | 1995 | 2001 | 2001 |

According to the U.S. Census data, the share of workers who car pooled has dropped from 19.7% in 1980 to 9.0% in 2016. The share of workers using public transit declined from 6.2% to 5.4% in the same time period. Those driving alone and those working at home increased. The average travel time increased by 4.4 minutes from 1980 to 2016. The American Community Survey (ACS) now collects journey-to-work data on an annual basis. It shows the average commute time as 26.1 minutes in 2016.

After 2001, only data on daily trips were collected in the NHTS. The 2001 data are still the latest available on long-distance trips.

Long Distance Trips – 2001 National Household Travel Survey

The 2001 National Household Travel Survey (NHTS) collected data on long-distance trips as well as everyday travel. The everyday travel data is a continuation of the Nationwide Personal Transportation Survey (NPTS), while the long-distance travel data is a continuation of the American Travel Survey (ATS) which was collected in 1977 and 1985. The survey collected trip-related data such as mode of transportation, duration, distance and purpose of trip. It also gathered demographic, geographic, and economic data for analysis purposes.

A long-distance trip is defined as a trip of 50 miles or more, one-way. Long-trip data from the 2001 NHTS were released in the summer of 2004. For additional information about the 2001 NHTS data, go to the following website: nhts.ornl.gov.

Table 8.20Long-Distance Trip^a Characteristics, 2001 NHTS

Note: Long-distance trips were not included in the 2009 or 2017 NHTS.

Source:

U.S. Bureau of Transportation Statistics and the U.S. Federal Highway Administration, 2001 National Household Transportation Survey. (Additional resources: nhts.ornl.gov)

^a A long-distance trip is defined as a trip of 50 miles or more, one-way.

^b Includes other types of buses.

[°] Not applicable.

Chapter 9 Nonhighway Modes

Summary Statistics from Tables in this Chapter

Table 9.1Nonhighway Energy Use Shares, 1970–2016

Source:

See Appendix A, Section 2.3. Nonhighway Energy Use.

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

These data include ALL international and domestic certificated route air carrier statistics; therefore, the data are different than those in Chapter 2. Revenue aircraft-miles, passenger-miles, and seat-miles began to rise in 2010. Passenger load factor was 83.0% in 2017.

Table 9.2Summary Statistics for U.S. Domestic and International Certificated
Route Air Carriers (Combined Totals), 1970–2017^a

Sources:

U.S. Department of Transportation, Bureau of Transportation Statistics, www.transtats.bts.gov. (Additional resources: www.rita.dot.gov/bts)

1970–76 Energy Use – Department of Transportation, Civil Aeronautics Board, Fuel Cost and Consumption, Washington, DC, 1981, and annual.

^a Data are for all U.S. air carriers reporting on Form 41.

^c Passenger load factor is calculated as the ratio of revenue passenger-miles to available seat-miles for scheduled and nonscheduled services.

^d Energy use includes fuel purchased abroad for international flights.

^b Available seats per aircraft is calculated as the ratio of available seat-miles to revenue aircraft-miles.

General aviation includes: (1) aircraft operating under general operating and flight rules; (2) not-for-hire airplanes with a seating capacity of 20 or more or a maximum payload capacity of 6,000 lbs. or more; (3) rotorcraft external load operations; (4) on-demand and commuter operations not covered under Federal Aviation Regulations Part 121; and (5) agricultural aircraft operations.

Sources:

U.S. Department of Transportation, Federal Aviation Administration, *General Aviation and Part 135 Activity Surveys, CY 2016*, Tables 1.1, 1.4, 5.1, and annual. 2011 Data: *Aviation Forecasts*, Tables 28 and 29, May 2013. (Additional resources: www.faa.gov/data-research/aviation data statistics/general aviation)

^a Active fixed-wing general aviation aircraft only.

^b Includes rotorcraft.

In the early seventies, domestic waterborne commerce accounted for over 60% of total tonnage on United States waterways, but by 1994 foreign tonnage grew to more than half of all waterborne tonnage. Total foreign and domestic tons shipped were about 2.29 billion tons in 2016, down from a peak of 2.59 billion tons in 2006.

U.S. Department of the Army, Corps of Engineers, *Waterborne Commerce of the United States, Calendar Year 2016, Part 5—National Summaries*, November 2017, Table 1-1. (Additional resources: www.navigationdatacenter.us/index.htm)

^a All movements between the United States and foreign countries and between Puerto Rico and the Virgin Islands and foreign countries are classified as foreign trade.

^b All movements between U.S. ports, continental and noncontiguous, and on the inland rivers, canals, and connecting channels of the United States, Puerto Rico, and the Virgin Islands, excluding the Panama Canal. Beginning in 1996, fish was excluded for internal and intra-port domestic traffic.

The U.S. Army Corps of Engineers Navigation Data Center collects a wealth of waterborne commerce data. Energy use data, however, have never been collected as part of this effort. The energy use data collected by the Energy Information Administration (EIA) on vessel bunkering was formerly displayed on this table. The EIA data include different uses of fuel, not just fuel for domestic waterborne commerce; therefore, it was misleading to display those data together.

Ton-miles, tons shipped, average length of haul – U.S. Department of the Army, Corps of Engineers, *Waterborne Commerce of the United States, Calendar Year 2017, Part 5: National Summaries*, New Orleans, LA, 2017, Table 1-4 and annual. (Additional resources: www.navigationdatacenter.us/index.htm)

^a Grand total for self-propelled and non-self-propelled.

^b These figures are not consistent with the figures on Table 9.4 because intra-territory tons are not included in this table. Intra-territory traffic is traffic between ports in Puerto Rico and the Virgin Islands.

The data displayed in this table come from the Environmental Protection Agency's MOVES2014a model.

Table 9.6Recreational Boat Energy Use, 1970–2016

Source:

U.S. Environmental Protection Agency, MOVES2014a model, www3.epa.gov/otaq/models/moves.

The Interstate Commerce Commission designates Class I railroads on the basis of annual gross revenues. In 2016, seven railroads were given this designation. The number of railroads designated as Class I has changed considerably in the last 30 years; in 1976 there were 52 railroads given Class I designation.

| Table 9.7 |

Source:

Association of American Railroads, *Railroad Facts*, 2017 Edition, Washington, DC, September 2017, p. 64. (Additional resources: www.aar.org)

Revenue ton-miles for Class I freight railroads was nearly 1.6 trillion in 2016. Though there are many regional and local freight railroads, the Class I freight railroads accounted for 94% of the railroad industry's freight revenue in 2016 and 69% of the industry's mileage operated. The energy intensity of Class I railroads hit an all-time low of 289 Btu/ton-mile in 2010 and continued to be below 300 Btu/ton-mile in 2016.

Table 9.8Summary Statistics for Class I Freight Railroads, 1970–2016

Source:

Association of American Railroads, *Railroad Facts*, 2017 Edition, Washington, DC, September 2017, pp. 30, 31, 36, 37, 39, 50, and 65. (Additional resources: www.aar.org)

^a Does not include self-powered units.

^b Does not include private or shipper-owned cars. Beginning in 2001, Canadian-owned U.S. railroads are excluded.

^c Tons originated is a more accurate representation of total tonnage than revenue tons. Revenue tons often produces double-counting of loads switched between rail companies.

^d Data represent total locomotives used in freight and passenger service. Separate estimates are not available.

According to the 2012 Commodity Flow Survey, 7% of all freight ton-miles are rail intermodal shipments (truck/rail or rail/water). See Table 5.16 for details. Containerization has increased in the last two decades, evidenced by the 436% increase in the number of containers from 1988 to 2016. The number of trailers moved by rail fell to an all-time low in 2016.

- Energy use Personal communication with the Amtrak, Washington, DC. (Additional resources: www.amtrak.com, www.aar.org)

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

^b Data are not available.

^c Energy use for 1994 on is not directly comparable to earlier years. Some commuter rail energy use may have been inadvertently included in earlier years.

Commuter rail, which is also known as regional rail or suburban rail, is long-haul rail passenger service operating between metropolitan and suburban areas, whether within or across state lines. Commuter rail lines usually have reduced fares for multiple rides and commutation tickets for regular, recurring riders.

| | Number of passenger | Vehicle- miles | Passenger trips | Passenger- miles | Average trip length | Energy intensity (Btu/passenger- | Energy use (trillion |

^a Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses.

This table on transit rail operations includes data on light rail and heavy rail systems. Light rail vehicles are usually single vehicles driven electrically with power drawn from overhead wires. Heavy rail is characterized by high speed and rapid acceleration of rail cars operating on a separate right-of-way.

| | Number of | Vehicle- | Passenger | Passenger- | Average trip | Energy intensity | |

1970-2015: American Public Transportation Association, 2017 Public Transportation Fact Book, Washington, DC, March 2018, Appendix A. (Additional resources: www.apta.com)

2016: U.S. Department of Transportation, Federal Transit Administration, 2016 National Transit Database, accessed September 2018. (Additional resources: www.transit.gov/ntd)

Energy use - See Appendix A for Rail Transit Energy Use.

^a Heavy rail and light rail. Series not continuous between 1983 and 1984 because of a change in data source by the American Public Transit Association (APTA). Beginning in 1984, data provided by APTA are taken from mandatory reports filed with the Urban Mass Transit Administration (UMTA). Data for prior years were provided on a voluntary basis by APTA members and expanded statistically.

^b 1970–79 data represents total passenger rides; after 1979, data represents unlinked passenger trips.

[°] Estimated for years 1970–76 based on an average trip length of 5.8 miles.

^d Calculated as the ratio of passenger-miles to passenger trips.

^e Only end-use energy was counted for electricity. Previous editions included primary energy use for electricity which included generation and distribution losses. Large system-to-system variations exist for energy intensities. ^f Data are not available.

^g Average annual percentage change is calculated for years 1980–2015.

Adjusting Dollar Amounts for Inflation

A dollar spent in 1970 does not have the purchasing power of a dollar spent in 2016 due to the inflation of prices for all goods and services. Thus, prices in a historical series must be adjusted in order to provide proper comparison. The term "current dollars" is used in this report for dollar amounts that were current as of the year listed – this can also be referred to as "nominal dollars." The term "constant 2016 dollars" is used in this report for dollar amounts that have been adjusted to a constant purchasing power (2016, in this example) and thus the data are comparable historically – this can also be referred to as "real dollars."

Appendix B, Table B.17 contains the Consumer Price Inflation Index and Table B.18 contains the Gross National Product Implicit Price Deflator for years 1970 to 2016. Tables in the report with constant dollars have a footnote indicating which of these inflation adjustment indices were used.

The Transportation Services Index (TSI) was created by the U.S. Department of Transportation Bureau of Transportation Statistics (BTS). It is an index that measures the movement of freight and passengers.

The Freight TSI consists of:

- for-hire trucking (parcel services are not included);
- freight railroad services (including rail-based intermodal shipments such as containers on flat cars);
- inland waterway traffic;
- pipeline movements (including principally petroleum and petroleum products and natural gas); and
- air freight.

The index does not include international or coastal steamship movements, private trucking, courier services, or the United States Postal Services.

The Passenger TSI consists of:

- local mass transit;
- intercity passenger rail; and
- passenger air transportation.

The index does not include intercity bus, sightseeing services, taxi service, private car usage, or bicycling and other nonmotorized means of transportation.

^a Public assistance monies are included in reported income. Data for those reporting incomes.

^b Percentages may not sum to totals due to rounding.

^c Includes alcoholic beverages.

^d Includes personal care, reading, education, tobacco and smoking supplies, cash contributions, and miscellaneous items.

^e The term household refers to a "consumer unit," which is defined differently than households on Table 8.1.

The average amount of money that a household spends in a year has grown about 7% between 1985 and 2016 in constant dollar terms. Expenditures on transportation were 19.4% of the total in 1985 but were only 15.8% in 2016. Vehicle purchases made up about 40% of transportation expenditures in 2016, while gas and oil were 21%.

Table 10.4 and International Energy Agency, *Energy Prices & Taxes, Fourth Quarter, 2017, Paris, France, 2018.* (Additional resources: www.iea.org)

The cost of crude oil influences the price of gasoline, but it is not the only factor which determines the price at the pump. Refining cost, transportation cost, marketing cost, and taxes also play a part of the cost of a gallon of gasoline. The average price of a barrel of crude oil (in constant 2017 dollars) increased by 26% from 2000 to 2017, while the average price of a gallon of gasoline increased 11% in this same time period.

Table 10.5Prices for a Barrel of Crude Oil and a Gallon of Gasoline, 1978–2017

Sources:

Crude oil – U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2018, Washington, DC, Table 9.1.

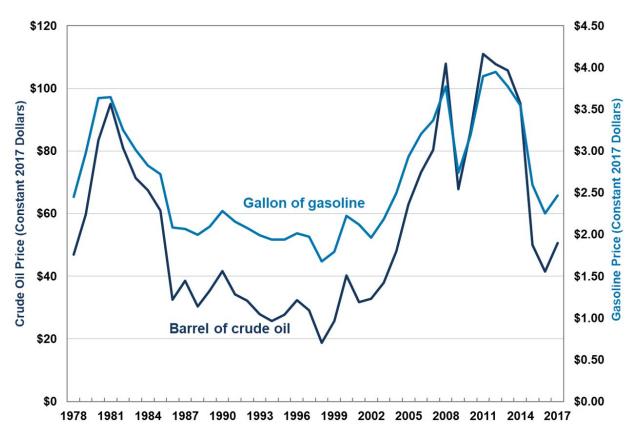

Gasoline – U.S. Department of Energy, Energy Information Administration, *Monthly Energy Review*, March 2018, Washington, DC, Table 9.4. (Additional resources: www.eia.doe.gov)

^a Refiner acquisition cost of composite (domestic and imported) crude oil.

^b Average for all types. These prices were collected from a sample of service stations in 85 urban areas selected to represent all urban consumers. Urban consumers make up about 80% of the total U.S. population.

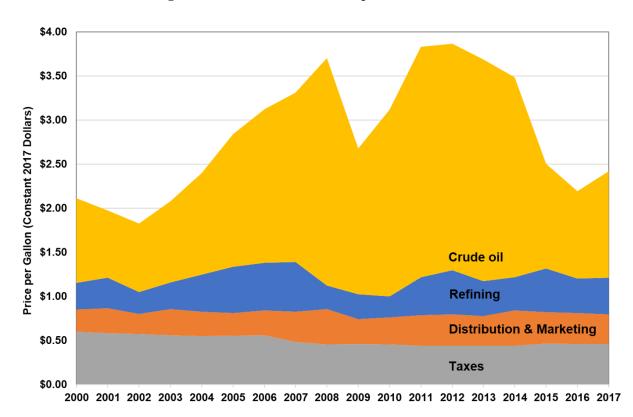

^c Adjusted by the Consumer Price Inflation Index.

Because crude oil is the main cost component for gasoline, the prices of a barrel of crude oil and a gallon of gasoline show similar trends.

Source: Table 10.5. The price of a gallon of gasoline changes depending on different price components, including taxes, distribution and marketing, refining, and crude oil. The largest component of gasoline price is crude oil. The cost of refining and the cost of crude oil are the most variable over the series.

Note: Based on regular motor gasoline in all areas. Annual averages were created from monthly component price data.

Source:

Energy Information Administration, Gasoline and Diesel Fuel Update, Gasoline Pump Components History, https://www.eia.gov/petroleum/gasdiesel/gaspump_hist.php. (Additional resources: www.eia.gov/petroleum/gasdiesel) The price of diesel fuel has been consistently higher than regular gasoline (in constant dollars) since 2005. Premium gasoline in 2017 averaged 50 cents higher than regular gasoline. Prices for diesel and gasoline declined substantially in 2016 but rose again in 2017.

^d Average annual percentage change is from the earliest year possible to 2017.

Major oil price shocks have disrupted world energy markets five times in the past 30 years (1973-74, 1979-80, 1990-91, 1999-2000, 2008). Most of the oil price shocks were followed by an economic recession in the United States.

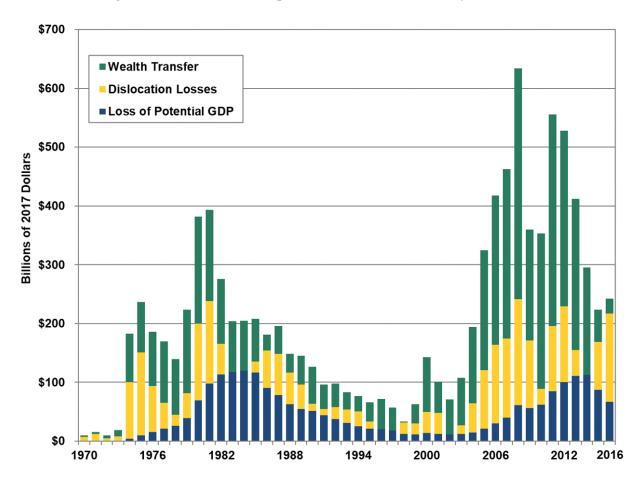

Source:

Greene, D.L. and N. I. Tishchishyna, *Costs of Oil Dependence: A 2000 Update*, Oak Ridge National Laboratory, ORNL/TM-2000/152, Oak Ridge, TN, 2000, and data updates, 2018.

The United States has long recognized the problem of oil dependence and the economic problems that arise from it. Greene, Lee and Hopson define oil dependence as a combination of four factors: (1) a noncompetitive world oil market strongly influenced by the Organization of the Petroleum Exporting Countries (OPEC) cartel, (2) high levels of U.S. imports, (3) the importance of oil to the U.S. economy, and (4) the lack of economical and readily available substitutes for oil. The most recent study shows that the U.S. economy suffered the greatest losses in 2008 when wealth transfer and gross domestic product (GDP) losses (combined) amounted to nearly half a trillion dollars. However, when comparing oil dependence to the size of the economy, the year 1980 is the highest. Low oil prices in 2009-2010 and 2013-2014 caused total dependence cost to drop; in 2016, the total cost was about \$242 billion (in 2017 dollars).

Notes:

Wealth Transfer is the product of total U.S. oil imports and the difference between the actual market price of oil (influenced by market power) and what the price would have been in a competitive market.

Dislocation Losses are temporary reductions in GDP as a result of oil price shocks.

Loss of Potential Gross Domestic Product (GDP) results because a basic resource used by the economy to produce output has become more expensive. As a consequence, with the same endowment of labor, capital, and other resources, our economy cannot produce quite as much as it could have at a lower oil price.

Source:

Greene, David L., Roderick Lee, and Janet L. Hopson, "OPEC and the Costs to the U.S. Economy of Oil Dependence: 1970-2010," Oak Ridge National Laboratory Memorandum, 2011, and updates from the ORNL Transportation Energy Evolution Modeling Team.

The fuel prices shown here are **refiner sales prices** of transportation fuels to end users, excluding tax. Sales to end users are those made directly to the ultimate consumer, including bulk consumers. Bulk sales to utility, industrial, and commercial accounts previously included in the wholesale category are now counted as sales to end users. Both propane and diesel prices fell drastically in 2015. Although both fuels experienced price increases from 2016 to 2017, they continue to be lower than 2014 prices.

Table 10.8Refiner Sales Prices for Aviation Gasoline and Jet Fuel, 1978–2017
(dollars per gallon, excluding tax)

Source:

U.S. Department of Energy, Energy Information Administration, Petroleum Data Analysis Tools, *Refiner Petroleum Product Prices by Sales Type*, April 2018, Washington, DC. (Additional resources: www.eia.doe.gov)

^a Adjusted by the Consumer Price Inflation Index.

^b EIA withheld value to avoid disclosure of individual company data.

^c Data through 2014.

The federal government taxes highway motor fuel and uses the money to pay for roadway upkeep and improvement, as well as other related expenditures. Compressed natural gas (CNG) and liquefied petroleum gas (LPG) taxes are calculated per energy equivalent of a gallon of gasoline, while liquified natural gas tax is calculated per energy equivalent of diesel.

| Fuel | Cents per gallon | Effective Date |
|--------------------------------------|-------------------|-----------------|
| Gasoline | 18.4 | October 1, 1997 |
| Diesel and kerosene | 24.4 | October 1, 1997 |
| Gasohol ^a | 18.4 | January 1, 2005 |

Public Law 114-41, July 31, 2015. (Additional resources: www.congress.gov/bill/114th-congress/house-bill/3236)

^a All gasohol blends are taxed at the same rate.

^b Includes benzol, benzene, naphtha, and other liquids used as a motor fuel.

^c Compressed natural gas and liquefied petroleum gas are 18.3 cents per energy equivalent of a gallon of gasoline.

^dLiquefied natural gas is 24.3 cents per energy equivalent of a gallon of diesel.

In addition to the 18.4 cents per gallon federal gasoline tax, the states also tax gasoline at varying rates. Some states have sales and/or use taxes added to gasoline excise taxes while others have inspection fees, environmental fees, leaking underground storage tank taxes, etc. The Energy Information Administration has compiled gasoline excise taxes, along with other state taxes and fees, to arrive at an estimate of the amount of state taxes consumers are paying per gallon.

Table 10.13Average Price of a New Car (Domestic and Import), 1970–2017

Note: These data are based on an average car and do not include prices for pickups, vans, or sport utility vehicles.

Source:

U.S. Department of Commerce, Bureau of Economic Analysis, *Average Transaction Price per New Car*, Washington, DC, 2018. (Additional resources: www.bea.gov)

^a Includes all vehicles produced in the United States regardless of manufacturer.

^b Adjusted by the Consumer Price Inflation Index.

The average price of a new light truck grew 46% from 1990-2017 in constant dollars terms, and by 173% when not adjusted for inflation. From the earliest available estimates in 2002, average prices for import light trucks were slightly higher than domestic prices until 2009. By 2017, domestic light truck prices averaged nearly \$5,000 higher than import prices.

Table 10.14Average Price of a New Light Truck^a (Domestic and Import), 1990-2017

Source:

U.S. Department of Commerce, Bureau of Economic Analysis, Underlying Detail, Motor Vehicle Output, August 2018 and Ward's Communications, www.wardsauto.com.

^a Light trucks in this table are 14,000 lb and less.

^b Includes all vehicles produced in the United States regardless of manufacturer.

^c Adjusted by the Consumer Price Inflation Index.

^d Data are not available.

The total cost of operating a car is the sum of the fixed cost (depreciation, insurance, finance charge, and license fee) and the variable cost (gas and oil, tires, and maintenance), which is related to the amount of travel. The gas and oil share of total cost was 12.6% in 2017 which is down from 18.4% in 2012.

Table 10.15Car Operating Cost per Mile, 1985–2017

Source:

Ward's Communications, *Motor Vehicle Facts and Figures 2017*, Southfield, Michigan, 2017, and annual. Original data from AAA "Your Driving Costs." (Additional resources: newsroom.aaa.com)

^a Adjusted by the U.S. Consumer Price Inflation Index. Can be converted to constant dollars using Table B.17.

^b Based on 10,000 miles per year.

While the previous table shows costs per mile, this table presents costs per year for fixed costs associated with car operation. For 2017 model year cars, the fixed cost is down to \$13.60 per day.

| | | License, | | Finance | | Average |

^a Not seasonally adjusted.

The total number of employees involved in the manufacture of motor vehicles decreased by 22% from 1990 to 2017 and by 10% for those involved in the manufacture of motor vehicle parts. Beginning in 2008, the share of production workers fell below 80% for manufacturers of both vehicles and parts and remained below 80% for motor vehicle parts.

^a OECD is the Organization for Economic Cooperation and Development. See Glossary for included countries.

Since 1990, China shows the greatest increase of carbon dioxide (CO_2) emissions. The Americas have increased CO_2 emissions by only 10% from 1990 to 2017. Europe and Eurasia have fewer CO_2 emissions in 2017 than 1990.

Global Warming Potentials (GWP) were developed to allow comparison of the ability of each greenhouse gas to trap heat in the atmosphere relative to carbon dioxide. Extensive research has been performed and it has been discovered that the effects of various gases on global warming are too complex to be precisely summarized by a single number. Further understanding of the subject also causes frequent changes to estimates. Despite that, the scientific community has developed approximations, the latest of which are shown below. Most analysts use the 100-year time horizon.

Table 11.2 Numerical Estimates of Global Warming Potentials Compared with Carbon Dioxide (kilogram of gas per kilogram of carbon dioxide)

| | Lifetime | Global warming potential direct effect for time horizons of | | |
|---|----------|---|-----------|--|
| Gas | (years) | 20 years | 100 years | |
| Carbon Dioxide (CO ₂) | 5-200ª | 1 | 1 | |
| Methane (CH ₄) ^b | 12.4 | 86 | 34 | |
| Tetrafluoroethane (HFC-134a) | 13.4 | 3,790 | 1,550 | |
| Trichlorofluoromethane (CFC-11) | 45 | 7,020 | 5,350 | |
| Nitrous Oxide (N ₂ O) | 121 | 268 | 298 | |
| Perfluoromethane (CF ₄) | 50,000 | 4,950 | 7,350 | |

Nauels, Y. Zia, V. Bex and P.M. Midgley (eds)]. Cambridge University Press, Cambridge, United Kingdom and New York, NY, USA.

^a No single lifetime can be defined for carbon dioxide due to different rates of uptake by different removal processes.

^b These values do not include carbon dioxide from methane oxidation. Perturbation lifetime is used in the calculation of metrics.

Carbon dioxide emissions in 2016 were 3% higher than in 1990, but down from the highest annual emissions of this data series in 2007. Carbon dioxide accounts for the majority (81%) of greenhouse gases.

Table 11.3U.S. Emissions of Greenhouse Gases, Based on Global Warming Potential, 1990–2016
(million metric tons of carbon dioxide equivalent*)

Note: This greenhouse gas emissions inventory includes fossil fuel combustion, use of fluorinated gases and other transportation categories.

Source:

U.S. Environmental Protection Agency, Inventory of U. S. Greenhouse Gas Emissions and Sinks: 1990-2016, April 12, 2018, EPA 430-R-18-003. (Additional resources: www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks-1990-2016)

^a Carbon dioxide equivalents are computed by multiplying the weight of the gas being measured by its estimated Global Warming Potential (See Table 11.2).

^b GWP = Global warming potential. Includes HFC-hydrofluorocarbons; PFC-perfluorocarbons; and SF₆-sulfur hexaflouride.

The transportation sector accounts for 34.1% of carbon dioxide emissions and 28.7% of all greenhouse gas emissions. The industrial sector is the only sector that accounts for more greenhouse gas emissions than the transportation sector.

^a Includes energy from petroleum, coal, and natural gas. Electric utility emissions are distributed across consumption sectors.

This report has typically displayed carbon and carbon dioxide data from the Environmental Protection Agency (EPA). However, the Energy Information Administration's (EIA's) Monthly Energy Review also includes carbon dioxide emission data. The differences in the two-data series have been about 5-7%, but as high as 8.5% in 1991. Reasons for the differences include the treatment of international bunker fuel, nonfuel use of fossil fuels, and the agencies' use of different fuel consumption control totals.

^a Data are not available.

Most U.S. transportation sector carbon dioxide emissions come from petroleum fuels. Motor gasoline has been responsible for 60%-65% of U.S. carbon dioxide emissions over the last 26 years.

The Greenhouse Gases, Regulated Emissions, and Energy Use in Transportation (GREET) Model

greet.es.anl.gov

Sponsored by the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy (EERE), Argonne has developed a full life-cycle model called GREET[®] (Greenhouse gases, <u>Regulated</u> <u>Emissions</u>, and <u>Energy</u> use in <u>T</u>ransportation). It allows researchers and analysts to evaluate energy and environmental impacts of various vehicle and fuel combinations on a life-cycle basis. The first version of GREET was released in 1996. Since then, Argonne has continued to update and expand the model. The most recent GREET versions are GREET 1 2018 version for fuel-cycle analysis and GREET 2 2018 version for vehicle-cycle analysis.

For a given vehicle and fuel system, GREET separately calculates the following:

- Consumption of total resources (energy in non-renewable and renewable sources), fossil fuels (petroleum, natural gas, and coal together), petroleum, coal, natural gas, and water.
- Emissions of CO₂-equivalent greenhouse gases primarily carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O).

• Emissions of seven criteria pollutants: volatile organic compounds (VOCs), carbon monoxide (CO), nitrogen oxide (NOx), particulate matter with size smaller than 10 micron (PM₁₀), particulate matter with size smaller than 2.5 micron (PM_{2.5}), black carbon (BC) and sulfur oxides (SOx).

GREET includes more than 100 fuel production pathways and more than 80 vehicle/fuel systems. These vehicle/fuel systems cover current and advanced vehicle technologies such as conventional sparkignition engine vehicles, compression-ignition engine vehicles, hybrid electric vehicles, plug-in hybrid electric vehicles, battery-powered electric vehicles and fuel-cell electric vehicles. GREET also evaluates transportation modes other than light-duty vehicles, such as heavy-duty vehicles, aviation, rail and marine.

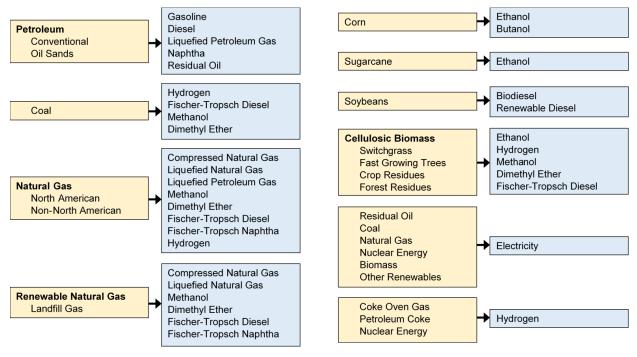

Figure 11.3. GREET Model Feedstocks and Fuels

To address technology improvements over time, GREET 2018 simulates current and future vehicle/fuel systems up to year 2050.

For additional information about the GREET model and associated documentation, please visit the GREET website www.greet.es.anl.gov, or contact greet@anl.gov.

Results from the GREET 1 2018 model on emissions of carbon dioxide equivalents per mile are shown for various fuels and vehicle technologies. A full description of the model is on the preceding pages.

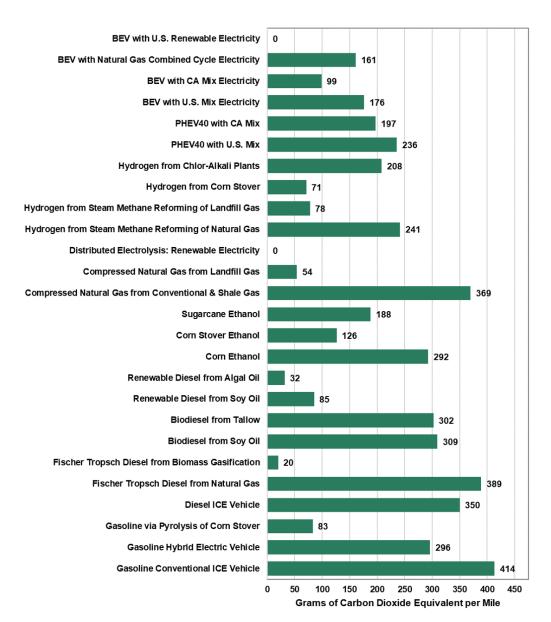

Figure 11.4. Well-to-Wheel Emissions for Various Fuels and Vehicle Technologies

Source:

Argonne National Laboratory, GREET WTW Calculator and Sample Results from GREET 1 2018, greet.es.anl.gov/results. (Additional resources: greet.es.anl.gov)

Greenhouse gas emissions associated with vehicle manufacturing (current technology) were estimated using the GREET model. Emissions from manufacturing the vehicle body are just over two million tonnes of carbon dioxide equivalent for each of the vehicle types. Emissions from the manufacture of the hydrogen on-board storage and fuel cell auxiliary cause the total emissions associated with the manufacture of a hydrogen fuel cell vehicle to be higher than the other vehicle types.

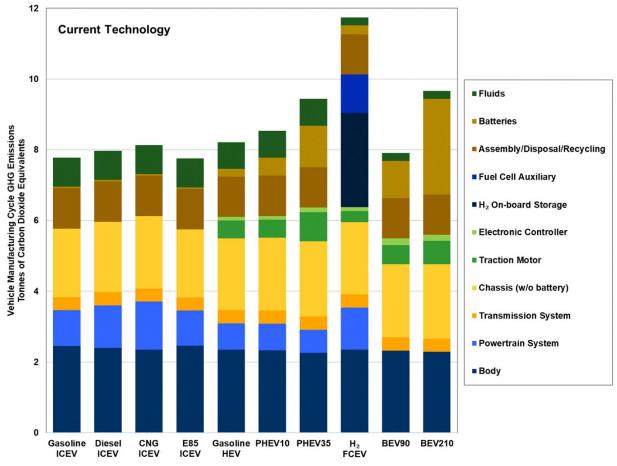

Figure 11.5. Vehicle Manufacturing Cycle Greenhouse Gas Emissions by Vehicle Component

Note: GHG = greenhouse gases. ICEV = internal combustion engine vehicle. CNG = compressed natural gas. E-85 = fuel with approximately 85% ethanol and 15% gasoline. HEV = hybrid-electric vehicle. PHEV10 = Plug-in electric vehicle with 10-mile electric range. PHEV35 = Plug-in hybrid electric vehicle with 35-mile electric range. H₂FCEV = Hydrogen fuel cell electric vehicle. BEV90 = Battery electric vehicle with a 90-mile range. BEV210 = Battery electric vehicle with a 210-mile range.

Carbon Footprint

The carbon footprint measures a vehicle's impact on climate change in tons of carbon dioxide (CO_2) emitted annually. The following three tables show the carbon footprint for various vehicle classes. The sales-weighted average fuel economy rating for each vehicle class, based on 45% highway and 55% city driving, is used to determine the average annual carbon footprint for vehicles in the class. An estimate of 15,000 annual miles is used for each vehicle class and for each year in the series.

CarbonFootprint =
$$\left(CO_2 \times LHV \times \frac{AnnualMiles}{CombinedMPG}\right) + \left(CH_4 + N_2O\right) \times AnnualMiles$$

where:

 $CO_2 = (Tailpipe CO_2 + Upstream Greenhouse Gases) in grams per million Btu$

LHV = Lower (or net) Heating Value in million Btu per gallon

 CH_4 = Tailpipe <u>CO₂ equivalent</u> methane in grams per mile

 $N_2O = Tailpipe CO_2$ equivalent nitrous oxide in grams per mile

Note: The Environmental Protection Agency publishes tailpipe emissions in terms of grams of CO₂ per mile in the *Light-Duty Automotive Technology, Carbon Dioxide Emissions, and Fuel Economy Trends:* 1975 through 2017, www.epa.gov/fueleconomy/trends-report.

The production-weighted average annual carbon footprint for cars and car SUVs declined by an average of 1.9% annually between 1975 and 2017.

^a The sums of subcategories may not equal total due to rounding.

Though gasoline-powered light vehicles continue to be responsible for the majority of carbon monoxide emissions from highway vehicles, the total pollution from light vehicles in 2005 is less than a fifth of what it was in 1970. This is despite the fact that there were many more light vehicles on the road in 2005. Between 2005 and 2011 the Environmental Protection Agency updated their source from the MOBILE 6.2 emissions model to the MOVES emission model. MOVES results typically show higher emissions, especially for heavy trucks. The 2014 data are the latest available.

^a The sum of subcategories may not equal total due to rounding. The EPA's definition of volatile organic compounds excludes methane, ethane, and certain other nonphotochemically reactive organic compounds.

Gasoline-powered vehicles are responsible for over 90% of highway vehicle emissions of volatile organic compounds. VOC emissions from highway vehicles in 2014 were less than one-quarter of the 1990 level. Between 2005 and 2011 the Environmental Protection Agency updated their source from the MOBILE 6.2 emissions model to the MOVES emission model. MOVES results typically show higher emissions, especially for heavy trucks. The 2014 data are the latest available.

EMISSION STANDARDS

The U.S. Environmental Protection Agency (EPA) regulates emissions from mobile sources including vehicles, engines, and motorized equipment that produce exhaust and evaporative emissions. Mobile sources contribute to four main air pollutants: carbon monoxide, hydrocarbons, nitrogen oxides, and particulate matter. The EPA not only sets standards for the vehicles, engines, and equipment, but also the fuels that they use. Tables 12.13 through Table 12.30 contain summaries of the current standards.

| | Acronyms Used on Tables 12.13 through Table 12.30 | | | | | | | | | |
|---------|---|-------|----------------------------------|--|--|--|--|--|--|--|
| ABT | Averaging, banking, and credit trading program | LLDT | Light light-duty truck | | | | | | | |
| ATV | All-terrain vehicle | LPG | Liquefied petroleum gas | | | | | | | |
| bhp | Brake horsepower-hour | LVW | Loaded vehicle weight | | | | | | | |
| CFR | Code of Federal Regulations | MDPV | Medium-duty passenger vehicle | | | | | | | |
| CI | Compression-ignition | | (8,500-10,000 lbs. GVWR) | | | | | | | |
| CO | Carbon Monoxide | MDV | Medium-duty vehicle | | | | | | | |
| DE | Diesel engine | MY | Model year | | | | | | | |
| EPA | Environmental Protection Agency | NMHC | Non-methane hydrocarbon | | | | | | | |

| kN | Kilonewton | THC | Total hydrocarbons | | | | | | | |
| kW | Kilowatt | THCE | Total hydrocarbon equivalent | | | | | | | |
| kW-hr | Kilowatt-hour | ULEV | Ultra-low-emission vehicle | | | | | | | |
| LDT | Light-duty truck | ULSD | Ultra-low sulfur diesel | | | | | | | |
| LDV | Light-duty vehicle | ZEV | Zero-emission vehicle | | | | | | | |
| LEV | Low-emission vehicle | | | | | | | | | |

The Environmental Protection Agency issued final Tier 3 emission standards in 2014. The combined emissions of non-methane organic gases (NMOG) and nitrogen oxides (NOx) that new gasoline engines are allowed to produce from model years 2017 to 2025 are regulated in these new standards. These standards apply to a corporate average, meaning that some vehicles produced in those model years will emit more than the standard, while others will emit less, so long as the average for each Original Equipment Manufacturer (OEM) product offerings meets the standard.

| Model Year | Light-duty vehicles and LDT1 | LDT2, 3, 4, and medium-duty passenger vehicles | Class 2b trucks | Class 3 trucks |
|----------------|------------------------------------|--|------------------|------------------|
| 2016 | а | a | 333 ^b | 548 ^b |
| 2017 | 86 | 101 | 310 ^b | 508 ^b |

| 2025 and later | 30 | 30 | 178 | 247 |

Table 12.13 Tier 3 Non-Methane Organic Gases and Nitrogen Oxide Standards (milligrams per mile)

Notes: Standards are for the Federal Test Procedure. Different standards apply for the Supplemental Federal Test Procedure. For vehicles over 6,000 lbs. gross vehicle weight rating (GVWR), the standards apply beginning in MY 2018.

LDT1 = Light trucks less than 6,000 lbs. GVWR and less than 3,750 lbs. loaded vehicle weight (LVW).

LDT2, 3, 4 = Light trucks less than 8,500 lbs. GVWR and more than 3,750 lbs. LVW.

Class 2b trucks = trucks 8,501-10,000 lbs. GVWR.

Class 3 trucks = trucks 10,001-14,000 lbs. GVWR.

Table 12.18Heavy-Duty Highway Compression-Ignition Engines and Urban Buses – Exhaust
Emission Standards

Note: The test procedures are the EPA Transient Test Procedure and the EPA Smoke Test Procedure. Definitions of acronyms are on page 12-14.

Sources:

40 CFR 86.099-11 Emission standards for 1999 and later model year diesel heavy-duty engines and vehicles. 40 CFR 86.004-11 Emission standards for 2004 and later model year diesel heavy-duty engines and vehicles. 40 CFR 86.007-11 Emission standards and supplemental requirements for 2007 and later model year diesel heavy-

duty engines and vehicles. (Additional resources: www.epa.gov/emission-standards-reference-guide/lightduty-vehicles-and-trucks-emission-standards)

^a Percentages apply to smoke opacity at acceleration/lug/peak modes.

^b Standards for 1990 apply only to diesel-fueled heavy-duty engines (HDE). Standards for 1991+ apply to both diesel- and methanol-fueled HDEs. Standards that apply to urban buses specifically are footnoted.

^c This standard applies to the following fueled engines for the following model years: methanol - 1990+, natural gas and liquefied petroleum gas (LPG) - 1994+.

^d For petroleum-fueled engines, the standard is for hydrocarbons (HC). For methanol-fueled engines, the standard is for total hydrocarbon equivalent (THCE).

^e Certification standard for urban buses for 1993.

^f Certification standard for urban buses from 1994-95.

^g Certification standard for urban buses from 1996 and later. The in-use standard is 0.07.

^h Load Response Test certification data submittal requirements take effect for heavy-duty diesel engines beginning in model year 2004. The following requirements take effect with the 2007 model year: steady-state test requirement and Not-to-Exceed (NTE) test procedures for testing of in-use engines. On-board diagnostic requirements applicable to heavy-duty diesel vehicles and engines up to 14,000 pounds gross vehicle weight rating (GVWR) phase in from the 2005 through 2007 model years.

Table 12.18 (continued) Heavy-Duty Highway Compression-Ignition Engines and Urban Buses – Exhaust Emission Standards

^k Starting in 2006, refiners must begin producing highway diesel fuel that meets a maximum sulfur standard of 15 parts per million (ppm).

¹ Subject to a Supplemental Emission Test (1.0 x Federal Test Procedure [FTP] standard (or Family Emission Limit [FEL]) for nitrogen oxides [NOx], NMHC, and particulate matter [PM]) and a NTE test (1.5 x FTP standard [or FEL] for NOx, NMHC, and PM).

^m EPA adopted the lab-testing and field-testing specifications in 40 CFR Part 1065 for heavy-duty highway engines, including both diesel and Otto-cycle engines. These procedures replace those previously published in 40 Code of Federal Regulations (CFR) Part 86, Subpart N. Any new testing for 2010 and later model years must be done using the 40 CFR Part 1065 procedures.

ⁿ Two-phase in-use NTE testing program for heavy-duty diesel vehicles. The program begins with the 2007 model year for gaseous pollutants and 2008 for PM. The requirements apply to diesel engines certified for use in heavy-duty vehicles (including buses) with GVWRs greater than 8,500 pounds. However, the requirements do not apply to any heavy-duty diesel vehicle that was certified using a chassis dynamometer, including medium-duty passenger vehicles with GVWRs of between 8,500 and 10,000 pounds.

^o NOx and NMHC standards will be phased in together between 2007 and 2010. The phase-in will be on a percent-of-sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010.

^p Note that for an individual engine, if the useful life hours interval is reached before the engine reaches 10 years or 100,000 miles, the useful life shall become 10 years or 100,000 miles, whichever occurs first, as required under Clean Air Act section 202(d).

ⁱ The modified averaging, banking, and trading program for 1998 and later model year engines applies only to diesel cycle engines. Credits generated under the modified program may be used only in 2004 and later model years.

^j For heavy-duty diesel engines, there are three options to the measurement procedures currently in place for alternative fueled engines: (1) use a THC measurement in place of an non-methane hydrocarbon (NMHC) measurement; (2) use a measurement procedure specified by the manufacturer with prior approval of the Administrator; or (3) subtract two percent from the measured THC value to obtain an NMHC value. The methodology must be specified at time of certification and will remain the same for the engine family throughout the engines' useful life. For natural gas vehicles, EPA allows the option of measuring NMHC through direct quantification of individual species by gas chromatography.

| | Engine or vehicle | Year | Gross vehicle weight (lbs) | HC ^a (g/bhp-hr) | NMHC ^b (g/bhp- hr) | NOx (g/bhp-hr) | NOx + NMHC ^c (g/bhp-hr) | PM (g/bhp- hr) | CO (g/bhp-hr) | Idle CO (% exhaust gas flow) | Formaldehyde (g/mile) | Useful life (years / miles) |

40 CFR 86.1816-05, 86.1816-08 Emission standards for complete heavy-duty vehicles

40 CFR 86.1806-01, 86.1806-04, 86.1806-05 Onboard diagnostics requirements

40 CFR 86.1817-05, 86.1817-08 Complete heavy-duty vehicle averaging, banking, and trading program

40 CFR 86.091-10 Heavy-duty engine averaging, banking, and trading program for 1991 and later - Not available in the e-CFR

40 CFR Part 86 Subpart B Vehicle test procedures (Additional resources: www.epa.gov/emission-standardsreference-guide/light-duty-vehicles-and-trucks-emission-standards)

^a For methanol-fueled engines, the standard is for total hydrocarbon equivalent (THCE).

^b For methanol and alcohol fueled vehicles the standard is for non-methane hydrocarbon equivalent (NMHCE).

° For methanol fueled engines the standard is for nitrogen oxides (NOx) plus NMHCE.

^d Standards for heavy-duty engines are expressed in grams per brake horsepower-hour (g/bhp-hr). Starting with the 1998 model year, crankcase emissions are not allowed.

^e Standards for 1990 apply to gasoline and methanol-fueled engines.

^f Standards for 1991 and later apply to gasoline and methanol engines and are optional for natural gas and Liquefied Petroleum Gas-fueled engines through the 1996 model year.

^g For natural gas fueled engines the standard is 0.9 g/bhp-hr non-methane hydrocarbon (NMHC).

Table 12.19 (continued) Heavy-Duty Highway Spark-Ignition Engines – Exhaust Emission Standards

^k Useful life is expressed in years or miles, whichever comes first. Useful life for the 1998 and later NOx standard and for all 2004 standards is 10 years or 110,000 miles, whichever comes first.

¹ Manufacturers can choose this standard or one of the following options: (1) a standard of 1.5 g/bhp-hr NMHC+NOX that applies to the 2004 through 2007 model years, with complete heavy-duty vehicle standards taking effect in 2005; or (2) a standard of 1.5 g/bhp-hr NMHC + NOX that would apply to the 2003 through 2007 heavy-duty engines and optionally to 2003 through 2006 complete heavy-duty vehicles.

^m Standard is expressed as non-methane organic gas, but compliance can optionally be shown using measurement of NMHC or total hydrocarbon (THC).

ⁿ Complete heavy-duty vehicles have the primary load-carrying container or device attached. Incomplete heavyduty vehicles are certified to heavy-duty engine standards. Standards for complete heavy-duty vehicles are expressed in grams per mile (g/mi). Starting in 2005 (or 2003 or 2004 depending on the selected phase in option; see footnote l), complete heavy-duty vehicles under 14,000 lbs gross vehicle weight are tested on chassis-based rather than enginebased procedures and must meet these complete heavy-duty vehicle standards.

° Although expressed as NMHC, compliance can optionally be shown using measurement of NMOG or THC.

^p At least 50 percent of a manufacturer's sales must meet these standards in 2008, with 100 percent required in 2009.

 q Gross vehicle weight ranges are more accurately specified as follows: 8,500 \leq GVW \leq 10,000 and 10,000 < GVW < 14,000.

^h For natural gas fueled engines the standard is 1.7 g/bhp-hr NMHC.

ⁱ The NOx standard is 5.0 for all natural gas-fueled engines.

^j This standard applies to the following engines utilizing aftertreatment technology (except for methanol) for the following model years: gasoline/1990+; natural gas and LPG/1991+; methanol/1990+. Starting in 2005, engines certified to on-board diagnostics requirements are not required to meet the idle carbon monoxide (CO) standard.

^a Applies to gasoline and methanol engines. Standard is hydrocarbon (HC) for gasoline engines, total hydrocarbon equivalent (THCE) for methanol engines.

^b For spark-ignition (SI) engines, standard applies to gasoline, methanol, natural gas, and liquefied petroleum gas engines. For compression-ignition (CI) engines, standard applies to methanol, natural gas, and liquefied petroleum gas engines. Standard is THCE for methanol engines, HC for others.

^c For SI engines, standard applies to gasoline and methanol engines. For CI engines, standard applies to methanol engines. Standard is THCE for methanol engines, HC for others.

^d Useful life is expressed in years or miles, whichever comes first.

^e Vehicles over 26,000 pounds gross vehicle weight may demonstrate compliance with an engineering design evaluation in lieu of testing.

^f A new enhanced evaporative test procedure applies, which is considerably more stringent than the previous test procedure despite the fact that the standard values do not change from prior years. Gasoline and methanol engines are phased in at the following rates of a manufacturer's sales for the specified model year: 1996: 20 percent; 1997: 40 percent; 1998: 90 percent; 1999: 100 percent.

^g A new enhanced evaporative test procedure applies, which is considerably more stringent than the previous test procedure despite the fact that the standard values do not change from prior years. Methanol-fueled vehicles are phased in at a rate of 90 percent of a manufacturer's production in 1998 and 100 percent in 1999.

The LEV III exhaust standards apply to new cars, light trucks, and medium vehicles, including fuel-flexible, bi-fuel, and dual-fuel vehicles from model year 2015-on.

Table 12.21California New Car, Light Truck and Medium Truck Emission Certification Standards,
Model Year 2015-On

| Vehicle type | Vehicle emission category | Non-methane organic gases + nitrogen oxides (g/mi) | Carbon monoxide (g/mi) | Formaldehyde (mg/mi) | Particulates (g/mi) |

Table 12.22 Aircraft – Exhaust Emission Standards

Note: The test procedures are the International Civil Aviation Organization (ICAO) Smoke Emission Test Procedure and the ICAO Gaseous Emissions Test Procedure. There is no useful life or warranty period for purposes of compliance with aircraft emissions standards. Definitions of acronyms are on page 12-14.

Source:

40 CFR Part 87, Aircraft emission standards, test procedures, certification requirements (Additional resources: www.epa.gov/emission-standards-reference-guide/nonroad-engines-and-vehicles-emission-standards)

- TF=all turbofan and turbojet aircraft engines except engines of Class T3, T8, and TSS
- T3=all aircraft gas turbine engines of the JT3D model family
- TSS=all aircraft gas turbine engines for aircraft operations at supersonic flight speeds
- TP=all aircraft turboprop engines

^b Federal standards apply to planes operating in the United States, regardless of where they were manufactured.

^c Rated output (rO) is the maximum power/thrust available for takeoff.

^a T8=all aircraft gas turbine engines of the JT8D model family

^d T3 engines are no longer manufactured but are in the existing fleet.

These standards apply to construction and agricultural equipment, such as excavators, paving equipment, tractors, combines, bulldozers, and skidders.

www.epa.gov/emission-standards-reference-guide/nonroad-engines-and-vehicles-emission-standards)

^b Useful life and warranty period are expressed hours and years, whichever comes first.

^c Hand-startable air-cooled direct injection engines may optionally meet a PM standard of 0.60 g/kW-hr. These engines may optionally meet Tier 2 standards through the 2009 model years. In 2010 these engines are required to meet a PM standard of 0.60 g/kW-hr.

^d Useful life for constant speed engines with rated speed 3,000 revolutions per minute (rpm) or higher is 5 years or 3,000 hours, whichever comes first.

^e These Tier 3 standards apply only to manufacturers selecting Tier 4 Option 2. Manufacturers selecting Tier 4 Option 1 will be meeting those standards in lieu of Tier 3 standards.

^f A manufacturer may certify all their engines to either Option 1 or Option 2 sets of standards starting in the indicated model year. Manufacturers selecting Option 2 must meet Tier 3 standards in the 2008-2011 model years.

^g These standards are phase-out standards. Not more than 50 percent of a manufacturer's engine production is allowed to meet these standards in each model year of the phase out period. Engines not meeting these standards must meet the final Tier 4 standards.

^h These standards are phased in during the indicated years. At least 50 percent of a manufacturer's engine production must meet these standards during each year of the phase in. Engines not meeting these standards must meet the applicable phase-out standards.

ⁱ For Tier 1 engines the standard is for total hydrocarbons.

^j The NOx standard for generator sets is 0.67 g/kW-hr.

^k The PM standard for generator sets is 0.03 g/kW-hr.

^a Smoke emissions may not exceed 20 percent during the acceleration mode, 15 percent during the lugging mode, and 50 percent during the peaks in either mode. Smoke emission standards do not apply to single-cylinder engines, constant-speed engines, or engines certified to a PM emission standard of 0.07 grams per kilowatt-hour (g/kW-hr) or lower. Smoke emissions are measured using procedures in 40 CFR Part 86 Subpart I.

These standards apply to gasoline and propane industrial equipment such as forklifts, generators, airport service equipment, compressors and ice-grooming machines.

40 CFR 1048.101 = Exhaust emission standards

40 CFR 1048.105 = Evaporative emission standards

emissions

Running

loss

40 CFR 1048.110 = Engine diagnostic requirements (Additional resources: www.epa.gov/emission-standardsreference-guide/nonroad-engines-and-vehicles-emission-standards)

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of hydrocarbon emissions for engines powered by the following fuels: (1) non-methane hydrocarbons (NMHC) for natural gas; (2) total hydrocarbon equivalent (THCE) for alcohol; and (3) total hydrocarbons (THC) for other fuels.

^b Voluntary Blue Sky standards for large spark-ignition (SI) engines are available. Engines with displacement at or below 1,000 cubic centimeters (cc) and maximum power at or below 30 kilowatts (kW) may be certified under the program for small SI engines.

^c Emission standards are based on testing over a steady-state duty-cycle.

^d The Tier 1 HC plus nitrogen oxides (NOx) emission standard for in-use testing is 5.4 grams per kW-hour (g/kW-hr).

^e Useful life is expressed in years and hours, whichever comes first. These are the minimum useful life requirements. For severe-duty engines, the minimum useful life is seven years or 1,500 hours of operation, whichever comes first. A longer useful life in hours is required if: (a) the engine is designed to operate longer than the minimum useful life based on the recommended rebuild interval; or (b) the basic mechanical warranty is longer than the minimum useful life.

^f Optional engine certification is allowed according to the following formula: (HC+NOx) \times CO^{0.784} \leq 8.57. The HC+NOx and carbon monoxide (CO) emission levels selected to satisfy this formula, rounded to the nearest 0.1 g/kW-hr, become the emission standards that apply for those engines. One may not select an HC+NOx emission standard higher than 2.7 g/kW-hr or a CO emission standard higher than 20.6 g/kW-hr.

| | Duty- cycle ^b | Tier | Year ^c | HC ⁱ (g/hp-hr) | NOx (g/bhp-hr) | PM (g/bhp-hr) | CO (g/bhp-hr) | Smoke (percentage) ^m | Minimum useful life (hours / years / miles) ⁿ |

 Table 12.25

 Locomotives – Exhaust Emission Standards

Source:

40 CFR 1033.101 = Emission Standards and Useful Life. (Additional resources: www.epa.gov/emission-standardsreference-guide/nonroad-engines-and-vehicles-emission-standards)

^a These standards apply to locomotives that are propelled by engines with total rated horsepower (hp) of 750 kilowatts (kW) (1006 hp) or more, unless the owner chooses to have the equipment certified to meet the requirements of locomotives. This does not include vehicles propelled by engines with total rated horsepower of less than 750 kW (1006 hp); see the requirements in 40 Code of Federal Regulations (CFR) Parts 86, 89 and 1039. The test procedures specify chassis-based testing of locomotives. These test procedures include certification testing, production line testing, and in-use testing using the Federal Test Procedure (FTP) when the locomotive has reached between 50-70 percent of its useful life.

^b Line-haul locomotives are powered by an engine with a maximum rated power (or a combination of engines having a total rated power) greater than 2300 hp. Switch locomotives are powered by an engine with a maximum rated power (or a combination of engines having a total rated power) of 2300 hp or less.

^c The Tier 0 standards apply to locomotives manufactured after 1972 when they are manufactured or remanufactured. Note that interim standards may apply for Tier 0 or Tier 1 locomotives remanufactured in 2008 or 2009, or for Tier 2 locomotives manufactured or remanufactured in 2008-2012.

_d Line-haul locomotives subject to the Tier 0 through Tier 2 emission standards must also meet switch standards of the same tier.

^e The Tier 0 standards apply for 1993-2001 locomotives not originally manufactured with a separate loop intake air cooling system.

^f Tier 3 line-haul locomotives must also meet Tier 2 switch standards.

^g Manufacturers using credits may elect to meet a combined nitrogen oxides (NOx) plus hydrocarbon (HC) standard of 1.4 grams per brakehorsepower-hour (g/bhp-hr) instead of the otherwise applicable Tier 4 NOx and HC standards.

^h Tier 1 and Tier 2 switch locomotives must also meet line-haul standards of the same tier.

ⁱ The numerical emission standards for HC must be met based on the following types of hydrocarbon emissions for locomotives powered by the following fuels: (1) alcohol: total hydrocarbon equivalent (THCE) emissions for Tier 3 and earlier locomotives, and non-methane hydrocarbon equivalent (NMHCE) for Tier 4; (2) natural gas and liquefied petroleum gas: non-methane hydrocarbon (NMHC) emissions; and (3) diesel: total hydrocarbon (THC) emissions for Tier 3 and earlier locomotives, and NMHC for Tier 4.

Table 12.25 (continued)Locomotives – Exhaust Emission Standards

^m The smoke opacity standards apply only for locomotives certified to one or more PM standards or Family Emission Limits (FEL) greater than 0.05 g/bhp-hr. Percentages apply to smoke opacity at steady state/30-second peak/3-second peak, as measured continuously during testing.

ⁿ Useful life and warranty period are expressed in megawatt-hours (MW-hr), years, or miles, whichever comes first. Manufacturers are required to certify to longer useful lives if their locomotives are designed to last longer between overhauls than the minimum useful life value.

° For locomotives originally manufactured before January 1, 2000, and not equipped with MW-hr meters.

^j Manufacturers may elect to meet a combined NOx+HC standard of 1.4 g/bhp-hr instead of the otherwise applicable Tier 4 NOx and HC standards.

^k The line-haul particulate matter (PM) standard for newly remanufactured Tier 2 locomotives is 0.20 g/bhp-hr until January 1, 2013, except as specified in 40 CFR Part 1033.150(a).

¹The switch PM standard for new Tier 2 locomotives is 0.24 g/bhp-hr until January 1, 2013, except as specified in 40 CFR Part 1033.150(a).

These standards apply to auxiliary and propulsion engines used by all types of recreational and commercial vessels, from small fishing boats to ocean-going ships.

| | Category ^{a, b} | Tier | Displacement (L/cylinder) | Power [°] (kW) | Speed (rpm) | Model Year | NOx (g/kW- hr) | HC (g/kW- hr) | HC+NOx ^d (g/kW-hr) | PM (g/kW- hr) | CO (g/kW- hr) | | ul Life° s/hours) | | | | | | | | | |

 Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

Sources:

40 CFR 89.104 = Tiers 1 and 2 useful life & warranty period for marine CI engines less than 37 kW

40 CFR 89.112 = Tiers 1 and 2 emission standards for marine CI engines less than 37 kW

40 CFR 89 Subpart E = Tiers 1 and 2 test procedures for marine CI engines less than 37 kW

40 CFR 94.8 = Tiers 1 and 2 emission standards for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 94.9 = Tiers 1 and 2 useful life for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 94 Subpart B = Tiers 1 and 2 test procedures for C1 (both commercial & recreational), C2 and C3 engines

40 CFR 1042.101 = Tiers 3 and 4 exhaust emission standards and useful life

Table 12.26 (continued) Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

Sources (continued):

40 CFR 1042.107 = Tiers 3 and 4 evaporative emission standards engines using a volatile liquid fuel (e.g., methanol) 40 CFR 1042.120 = Tiers 3 and 4 warranty period

40 CFR 1042 Subpart F = Tiers 3 and 4 test procedures (Additional resources: www.epa.gov/emission-standardsreference-guide/nonroad-engines-and-vehicles-emission-standards)

^a For Tiers 1 and 2, Category 1 marine engines are greater than or equal to 37 kilowatts (kW) and have a displacement less than 5.0 liters per cylinder (L/cylinder); Category 2 marine engines have a displacement greater than or equal to 5.0 L/cylinder and less than 30 L/cylinder; and Category 3 marine engines have a displacement greater than or equal to 30.0 L/cylinder. For Tiers 3 and 4, Category 1 represents engines up to 7 L/cylinder displacement; and Category 2 includes engines from 7 to 30 L/cylinder. The definition of Category 3 marine engines remains the same.

^b Tiers 1 and 2 for marine engines less than 37 kW are subject to the same emission standards as for land-based engines. See Table 1 in 40 Code of Federal Regulations (CFR) Part 89.112 and 40 CFR Part 89.104.

^c For Tiers 1 and 2, this refers to the rated power; for Tiers 3 and 4, this refers to the maximum engine power. ^d Total hydrocarbon (THC) plus nitrogen oxides (NOx) for Tier 2 standards.

^e Useful life is expressed in hours or years, whichever comes first. For Tiers 3 and 4, a longer useful life in hours for an engine family must be specified if either:1) the engine is designed, advertised, or marketed to operate longer than the minimum useful life; or 2) the basic mechanical warranty is longer than the minimum useful life.

^f Warranty period is expressed in years and hours, whichever comes first.

^g For Tiers 3 and 4, there are no evaporative emission standards for diesel-fueled engines, or engines using other nonvolatile or nonliquid fuels (e.g., natural gas). If an engine uses a volatile liquid fuel, such as methanol, the engine's fuel system and the vessel in which the engine is installed must meet the evaporative emission requirements of 40 Code of Federal Regulations (CFR) Part 1045 that apply with respect to spark-ignition engines. Manufacturers subject to evaporative emission standards must meet the requirements of 40 CFR 1045.112 as described in 40 CFR 1060.1(a)(2).

^h Indicates the model years for which the specified standards start.

ⁱ N is the maximum test speed of the engine in revolutions per minute (rpm).

^j Manufacturers of Tier 3 engines greater than or equal to 19 kW and less than 75 kW with displacement below 0.9 L/cylinder may alternatively certify some or all of their engine families to a particulate matter (PM) emission standard of 0.20 grams per kilowatt-hour (g/kW-hr) and a NOx+HC emission standard fo 5.8 g/kW-hr for 2014 and later model years.

^k The applicable Tier 2 NOx+HC standards continue to apply instead of the Tier 3 values for engines at or above 2000 kW.

¹These Tier 3 standards apply to Category 1 engines below 3700 kW except for recreational marine engines at or above 3700 kW (with any displacement), which must meet the Tier 3 standards specified for recreational marine engines with a displacement of 3.5 to 7.0 L/cylinder.

^m The following provisions are optional: 1) Manufacturers may use NOx credits to certify Tier 4 engines to a NOX+HC emission standard of 1.9 g/kW-hr instead of the NOX and HC standards. See 40 CFR 1042.101(a)(8)(i) for more details. 2) For engines below 1000 kW, manufacturers may delay complying with the Tier 4 standards until October 1, 2017. 3) For engines at or above 3700 kW, manufacturers may delay complying with the Tier 4 standards until December 31, 2016.

ⁿ The Tier 4 standard is for HC (not HC+NOx) in g/kW-hr.

^o These Tier 3 standards apply to Category 2 engines below 3700 kW; no Tier 3 standards apply for Category 2 engines at or above 3700 kW, although there are Tier 4 standards that apply.

Table 12.26 (continued) Marine Compression-Ignition (CI) Engines – Exhaust Emission Standards

^p An alternative set of Tier 3 and Tier 4 standards for PM, NOx, and HC are available for Category 2 engines at or above 1400 kW, but must be applied to all of a manufacturer's engines in a given displacement category in model years 2012 through 2015.

| | Maximum | | | | |
|------|----------------------|-----------|-----------|-----------|-----------|
| | engine | Model | PM | NOx | HC |
| Tier | power | year | (g/kW-hr) | (g/kW-hr) | (g/kW-hr) |
| 3 | $kW \ge 1400$ | 2012-2014 | 0.14 | 7.8 N | Ox+HC |
| 4 | $1400 \le kW < 3700$ | 2015 | 0.04 | 1.8 | 0.19 |
| 4 | $kW \ge 3700$ | 2015 | 0.06 | 1.8 | 0.19 |

^q Interim Tier 4 PM standards apply for 2014 and 2015 model year Category 2 engines with per-cylinder displacement at or above 15.0 liters: 0.34 g/kW-hr for engines 2000 = kW < 3000, and 0.27 g/kW-hr for engines 3300 = kW < 3700.

These standards apply to gasoline boats and personal watercraft, such as pleasure boats, jet-skis, outboard engines and sterndrive/inboard engines.

 Table 12.27

 Marine Spark-Ignition Engines and Vessels – Exhaust Emission Standards

Sources:

40 CFR 91.104 = Outboard and personal watercraft (PWC) exhaust emission standards (1998-2009)

40 CFR 91.105 = Outboard and PWC useful life (1998-2009)

40 CFR 1045.103 = Outboard and PWC exhaust emission standards (2010+)

40 CFR 1045.105 = Sterndrive/Inboard exhaust emission standards

40 CFR 1045.107 = Not-to-exceed exhaust emission standards (Additional resources: www.epa.gov/emission-standards-reference-guide/nonroad-engines-and-vehicles-emission-standards)

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of HC emissions for engines powered by the following fuels: (1) total hydrocarbon equivalent for alcohol; (2) non-methane hydrocarbon for natural gas; and (3) total hydrocarbons for other fuels.

^b P stands for the maximum engine power in kilowatts.

^c Manufacturers may generate or use emission credits for averaging, but not for banking or trading.

^d Useful life and warranty period are expressed hours or years of operation (unless otherwise indicated), whichever comes first.

^e The test procedure for federal standards uses the International Organization for Standardization (ISO) 8178 E4 5-Mode Steady-State Test Cycle.

^f Also applies to model year (MY) 1997 engine families certified pursuant to 40 Code of Federal Regulations (CFR) 91.205.

^g Not-to-exceed emission standards specified in 40 CFR 1045.107 also apply.

^h A longer useful life in terms of hours must be specified for the engine family if the average service life is longer than the minimum value as described in 40 CFR 1045.103(e)(3).

ⁱ The useful life may not be shorter than: (1) 150 hours of operation; (2) the recommended overhaul interval; or (3) the engine's mechanical warranty. A longer useful life must be specified in terms of hours if the average service life is longer than the minimum value as described in 40 CFR 1045.105(e)(3).

These standards apply to land-based recreational vehicles, such as snowmobiles, dirt bikes, all-terrain vehicles and go-karts.

| | Vehicle | Phase | Year | HC ^a g/kW-hr | HC + NOx g/km | C g/kW-hr | O g/km | Minimum useful life (hours/years/km) ^b |

 Table 12.28

 Nonroad Recreational Engines and Vehicles – Exhaust Emission Standards

Source:

40 CFR 1051.101-115 = Emission standards (Additional resources: www.epa.gov/emission-standards-referenceguide/nonroad-engines-and-vehicles-emission-standards)

^a The numerical emission standards for hydrocarbons (HC) must be met based on the following types of hydrocarbon emissions for recreational engines and vehicles powered by the following fuels: (1) non-methane hydrocarbons for natural gas; (2) total hydrocarbon equivalent for alcohol; and (3) total hydrocarbons for other fuels.

^b Useful life is expressed in hours, years, or kilometers, whichever comes first; warranty period is expressed in hours, months, or kilometers (km), whichever comes first. Nonroad recreational engines and vehicles must meet emission standards over their full useful life. A longer useful life in terms of km and hours must be specified for the engine family if the average service life is longer than the minimum value as described in 40 Code of Federal Regulations (CFR) 1051 Subpart B.

^c Test procedures for snowmobiles use the equipment and procedures for spark-ignition engines in 40 CFR Part 1065.

^d Phase 1 standards will be phased in: 50 percent by 2006, 100 percent by 2007.

^e Litigation on the November 2002 final rule resulted in a court decision that requires EPA to clarify the evidence and analysis upon which the Phase 3 carbon monoxide (CO) and HC standards were based. EPA will address this in a future rulemaking.

^f These are the maximum allowable family emission limits (FEL). The HC and CO standards are defined by a functional relationship as described in 40 CFR 1051.103(a)(2).

^g For off-highway motorcycles and ATVs, chassis dynamometer emissions test procedures are specified in 40 CFR Part 86, Subpart F and engine dynamometer emissions test procedures are specified in 40 CFR Part 1065.

 $^{^{\}rm h}$ Maximum allowable FEL: 20.0 grams per kilometer (g/km) for HC plus nitrogen oxides (NOx) and 50 g/km for CO.

Table 12.28 (continued) Nonroad Recreational Engines and Vehicles – Exhaust Emission Standards

^k Manufacturers may certify all-terrain vehicles with engines that have total displacement of less than 100 cc to an HC+NOx standard of 25.0 g/kW-hr (with an FEL cap of 40.0 g/kW-hr) and a CO standard of 500 g/kW-hr.

ⁱ Manufacturers may certify off-highway motorcycles with engines that have total displacement of 70 cubic centimeters (cc) or less to an HC+NOx standard of 16.1 grams per kilowatt-hour (g/kW-hr) (with an FEL cap of 32.2 g/kW-hr) and a CO standard of 519 g/kW-hr.

^j Maximum allowable FEL for HC+NOx is 20.0 g/km.

The latest standards were established by the Environmental Protection Agency in conjunction with the Tier 3 emission standards.

Table 12.29Gasoline Sulfur Standards

Source:

40 CFR 80 Subpart H (Additional resources: www.epa.gov/emission-standards-reference-guide/fuel-sulfurstandards)

^a Standards effective January 1 at the refinery gate.

^b No Refinery Average Standard applies in 2004; Corporate Average Standard applies in 2004 (120 ppm) and 2005 (90 ppm).

^c Cap exceedances up to 50 ppm in 2004 must be made up in 2005.

^d Geographic Phase-in Area (GPA) refiners must also comply with the corporate average standards in 2004 and 2005 if less than 50% of the refiner's gasoline is designated as GPA gasoline in a given compliance period.

^e GPA refiners may receive an additional two years (i.e., through 2008) to comply with the 30 / 80 ppm gasoline sulfur standards in exchange for producing 95% of their highway diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

^f Small refiners may receive an additional two years (i.e., through 2009) to comply with the 30 / 80 ppm gasoline sulfur standards via a hardship demonstration.

^g Small refiners may receive an additional three years (i.e., through 2010) to comply with the 30 / 80 ppm gasoline sulfur standards in exchange for producing 95% of their highway diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

^h Small refiners may receive a 20% increase in their annual average and per-gallon cap standards in exchange for producing 95% of their highway, nonroad, locomotive, and marine diesel fuel at the 15 ppm sulfur standard by June 1, 2006.

ⁱ Downstream standards are effective February 1 at any downstream location other than at a retail outlet or wholesale purchaser-consumer (e.g., pipelines and terminals) and March 1 at any downstream location.

^j Downstream standards for gasoline that is not blended with small refiner gasoline are shown. Refer to the Code of Federal Regulations (CFR) for the downstream standards that apply when a gasoline blend includes small refiner gasoline.

| 1997-98 Refinery baseline sulfur level | Small refiner interim gasoline sulfur standards (ppm) 2004 - 2007 | | | | |
|---|--|---------------------|--|--|--|
| (ppm) | Average | Cap | | | |
| 0 to 30 | 30 | 300 | | | |

 Table 12.30

 Highway, Nonroad, Locomotive, and Marine (NRLM) Diesel Fuel Sulfur Standards

Source:

40 CFR 80 Subpart I (Additional resources: www.epa.gov/emission-standards-reference-guide/fuel-sulfurstandards)

^a For highway diesel fuel, standards are effective June 1 for refiners/importers, September 1 for pipelines and terminals, and October 15 for retailers and wholesale purchaser-consumers. Anti-downgrading provisions effective October 16, 2006.

^b For Nonroad, Locomotive, and Marine (NRLM) diesel fuel, standards are effective June 1 for refiners; downstream requirements apply for Northeast/Mid-Atlantic area only (August 1 for terminals, October 1 for retailers and wholesale purchaser-consumers, and December 1 for in-use).

^c For highway diesel fuel, standards are effective June 1 for refiners/importers, October 1 for pipelines and terminals, and December 1 for retailers and wholesale purchaser-consumers.

^d For NRLM diesel fuel, standards are effective June 1 for refiners, August 1 for terminals, October 1 for retailers and wholesale purchaser-consumers, and December 1 for in-use.

^e Excluding the Northeast and Alaska.

^f Excluding the Northeast, with approval in Alaska.

APPENDIX A

SOURCES & METHODOLOGIES

SOURCES & METHODOLOGIES

This appendix contains documentation of the estimation procedures used by ORNL. The reader can examine the methodology behind the estimates and form an opinion as to their utility. The appendix is arranged by subject heading. Only tables which contain ORNL estimations are documented in Appendix A; all other tables have sources listed at the bottom of the table. Since abbreviations are used throughout the appendix, a list of abbreviations is also included.

2. ENERGY USE SOURCES

2.1 HIGHWAY ENERGY USE

2.1.1 Cars

Fuel use in gallons (1970-2008) – DOT, FHWA, *Highway Statistics 2008*, Table VM-1 and annual editions back to 1996; DOT, FHWA, *Highway Statistics Summary* to 1995.

Fuel use in gallons (2009 – 2016) – See Section 7. Appendix A Car and Light Truck Shares.

Fuel type distribution for gallons – Fuel use was distributed among fuel types using the percentages shown in Table A.1. The FHWA discontinued gasohol data in 2005. Therefore, data from EIA, *Alternatives to Traditional Transportation Fuels*, 2006-2011, Table C1 were used through 2013. From 2014-on, author estimates were used, with knowledge of how the Renewable Fuels Standard affects the gasoline/gasohol mix.

Electricity use (2010-2016) – Estimates derived using cumulative electric vehicle (EV) and plug-in hybrid vehicle (PHEV) sales as a proxy for vehicle population; sales-weighted vehicle efficiencies from the U.S. Department of Energy and U.S. Environmental Protection Agency's vehicle database on www.fueleconomy.gov; and annual miles traveled from varying PHEV utility factors and EV usage assumptions. Methodology documented in an Argonne National Laboratory report *Impacts of Electrification of Light-Duty Vehicles in the United States, 2010-2017*, January 2018, www.ipd.anl.gov/anlpubs/2018/01/141595.pdf.

Table A.3Transit Bus Fuel Use

Note: CNG is reported in diesel-gallon equivalents.

^a Data are not available.

Intercity and School

Eno Transportation Foundation, *Transportation in America, 2001, Nineteenth Edition*, 2003, Washington, DC, pp. 20–23. School bus fuel was assumed to be 90% diesel fuel and 10% gasoline based on estimates from the National Association of State Directors of Pupil Transportation Services. Intercity bus fuel was assumed to be 100% diesel.

Table A.4Intercity and School Bus Fuel Use

*Estimated using the rate of change of bus vehicle-miles traveled from FHWA Highway Statistics, Table VM-1.

2.1.4 Trucks

Light Trucks

Fuel use in gallons (1970-2007) – DOT, FHWA, *Highway Statistics 2008*, Table VM-1 and annual editions back to 1996 and DOT, FHWA, *Highway Statistics Summary to 1995*.

Fuel use in gallons (2008 – 2016) – See Section 7. Appendix A Car and Light Truck Shares.

Fuel type distribution for gallons – Fuel use was distributed among fuel types using the percentages shown in Table A.1. The FHWA discontinued gasohol data in 2005. Therefore, data from EIA, *Alternatives to Traditional Transportation Fuels*, 2006-2011, Table C1 were used through 2013. From 2014-on, author estimates were used, with knowledge of how the Renewable Fuels Standard affects the gasoline/gasohol mix.

Electricity use (2010-2016) – Estimates derived using cumulative electric vehicle (EV) and plug-in hybrid vehicle (PHEV) sales as a proxy for vehicle population; sales-weighted vehicle efficiencies from the U.S. Department of Energy and U.S. Environmental Protection Agency's vehicle database on www.fueleconomy.gov; and annual miles traveled from varying PHEV utility factors and EV usage assumptions. Methodology documented in an Argonne National Laboratory report *Impacts of Electrification of Light-Duty Vehicles in the United States, 2010-2017*, January 2018, www.ipd.anl.gov/anlpubs/2018/01/141595.pdf.

A-12

Medium/Heavy Trucks

DOT, FHWA, *Highway Statistics 2016*, Table VM-1 and annual editions back to 1996 and DOT, FHWA, *Highway Statistics Summary to 1995*. The FHWA made methodology changes for *Highway Statistics 2009*. At that time, they published historical data back to 2007 which do not match the previous data. Total gallons for medium/heavy trucks are the sum of single-unit trucks and combination trucks.

| Table A.6 |
|--|
| Medium/Heavy Truck Fuel Use and Fuel Type Shares for Calculation of Energy Use |

^a Data are not continuous between 2006 and 2007 due to changes in methodology. See source for details.

Shares of Class 3-6 and 7-8 energy use by fuel type were calculated from the 2002 Vehicle Inventory and Use Survey (VIUS) and applied to all years 1970-2016.

| Share of energy use | | | |
|---------------------|-----------|-----------|-------|
| Fuel type | Class 3-6 | Class 7-8 | Total |
| Gasoline | 92% | 8% | 100% |
| Diesel | 14% | 86% | 100% |
| LPG | 99% | 1% | 100% |

 Table A.7

 Share of Medium and Heavy Truck Energy Use

2.2 OFF-HIGHWAY ENERGY USE

U.S. Environmental Protection Agency, MOVES2014a model, results generated September 2018. Gallons of fuel by fuel type were produced for agricultural equipment, airport equipment, construction and mining equipment, industrial equipment, lawn and garden equipment, logging equipment, railroad maintenance equipment, and recreational equipment. Some non-transportation-related equipment, such as generators, chain saws, compressors, and pumps, were excluded from the data.

2.3 NONHIGHWAY ENERGY USE

2.3.1 Air

General Aviation

DOT, FAA, *General Aviation and Part 135 Activity Surveys - CY 2016*, Table 5.1, and annual. 2011 Data: *Aviation Forecasts*, Tables 28 and 29, May 2013.

Table A.11Recreational Boating Fuel Use

2.3.3 Pipeline

The sum of natural gas, crude petroleum and petroleum product, and coal slurry and water.

Natural Gas

The amount of natural gas used to transport natural gas was defined as "pipeline fuel" as reported in DOE, EIA, *Natural Gas Annual 2016*, Table 1. Cubic feet were converted to Btu using 1,031 Btu/ft3. Electricity use was estimated using the following procedure as reported on p. 5-110 of J. N. Hooker et al., End Use Energy Consumption DataBase: Transportation Sector. The energy consumption of a natural gas pipeline was taken to be the energy content of the fuel used to drive the pumps. Some 94% of the installed pumping horsepower was supplied by natural gas. The remaining 6% of the horsepower was generated more efficiently, mostly by electric motors. The energy consumed by natural gas pipeline pumps that were electrically powered was not known. In order to estimate the electricity consumed, the Btu of natural gas pipeline fuel consumed was multiplied by a factor of 0.015.

Crude Petroleum and Petroleum Product

J. N. Hooker, *Oil Pipeline Energy Consumption and Efficiency*, ORNL-5697, ORNL, Oak Ridge, TN, 1981. (Data held constant; Latest available data.)

Coal Slurry and Water

W. F. Banks, Systems, Science and Software, *Energy Consumption in the Pipeline Industry*, LaJolla, CA, October 1977. (Data held constant; Latest available data.)

| conversion to Btu | Btu/gallon | Btu/kWhr |

Table A.16Intercity Rail Fuel Use

2.4 CALCULATION OF MILLION BARRELS PER DAY CRUDE OIL EQUIVALENT

One gallon of gasoline, diesel fuel, or lpg is estimated to be the equivalent of one gallon of crude oil. Petroleum used for electricity was calculated using the following formula:

({[(BTU*S)/G]/P}/365)/1000

| BTU = | Btus of electricity |
|-------|---------------------|
|-------|---------------------|

- S = Share of petroleum used in making primary electricity (Calculated from Table 2.6 from the EIA, Monthly Energy Review)
- G = Electricity generation and distribution (assumed 29%)
- P = Btus per barrel of petroleum product (Table A3 from the EIA, Monthly Energy Review).

3. PASSENGER TRAVEL AND ENERGY USE

3.1 CARS

Number of vehicles – DOT, FHWA, *Highway Statistics 2016*, Table MV-1 and annual editions back to 2009. From 1970-2008, Table VM-1 was used.
Vehicle-miles – See Appendix A, Section 7. Car and Light Truck Shares.
Passenger-miles – Vehicle-miles multiplied by an average load factor.
Load factor – 2017 NHTS shows car load factor as 1.54 persons per vehicle.
Energy intensities –

Btu per vehicle-mile – Car energy use divided by vehicle-miles.

Btu per passenger-mile – Car energy use divided by passenger-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 2.9.

3.2 LIGHT TRUCKS

Number of vehicles – DOT, FHWA, *Highway Statistics 2016*, Table MV-9 and annual editions back to 2009. From 1970-2008, Table VM-1 was used. Columns for pickups, vans, sport utility vehicles, and other light trucks. Data were multiplied by the shares of light trucks which are for personal use (Table A.17) which were derived by ORNL from the 2002 VIUS Micro Data File on CD.

Vehicle-miles – See Appendix A, Section 7. Car and Light Truck Shares. Data were multiplied by the shares of vehicle miles which are for personal use (Table A.17) which were derived by ORNL from the 2002 VIUS Micro Data File on CD.

Passenger-miles – Vehicle-miles multiplied by an average load factor.

Load factor – 2017 NHTS shows personal light truck load factor as 1.82 persons per vehicle. Energy intensities -

- *Btu per vehicle-mile* Personal light truck energy use divided by personal light truck vehicle-miles.
- *Btu per passenger-mile* Personal light truck energy use divided by personal light truck passenger-miles.
- **Energy use** See Section 2. Energy Use Sources (light trucks, medium/heavy trucks). Data by truck type were multiplied by the shares of truck fuel use which are for personal use (Table A.17) which were derived by ORNL from the 2002 VIUS Micro Data File on CD.

| Personal trucks | |
|-------------------------|--|
| 85.6% | 2-axle, 4-tire trucks |
| 26.9% | Other single-unit and combination trucks |
| Personal truck travel | |
| 80.9% | 2-axle, 4-tire trucks |
| 13.1% | Other single-unit and combination trucks |
| Personal truck fuel use | |
| 78.0% | 2-axle, 4-tire trucks |
| 6.0% | Other single-unit and combination trucks |

Table A.17Share of Trucks, Truck Travel,and Fuel Use for Personal Travel

Note: Since these shares come from the 2002 VIUS, they may underestimate the amount of personal trucks, truck travel, and energy use for 2016.

3.3 MOTORCYCLES

Number of vehicles, vehicle-miles – DOT, FHWA, *Highway Statistics 2016*, Table VM-1. Passenger-miles – Vehicle-miles multiplied by an average load factor. Load factor – 2017 NHTS shows motorcycle load factor as 1.20 persons per vehicle. Energy intensities –

Btu per vehicle-mile – Motorcycle energy use divided by vehicle-miles.

Btu per passenger-mile – Motorcycle energy use divided by passenger-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 2.9.

3.4 DEMAND RESPONSE

 Number of vehicles, vehicle-miles, passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2018.
 Load factor – Passenger-miles divided by vehicle-miles.
 Energy intensities –

Btu per vehicle-mile – Energy use divided by vehicle-miles.

Btu per passenger-mile – Energy use divided by passenger-miles.

Energy use – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2018.

Note that all Demand Response data are for 2015.

3.5 BUSES

3.5.1 Transit

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2016. Data series shown on Table 7.9. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities –

Btu per vehicle-mile – Transit bus energy use divided by transit bus vehicle-miles.
 Btu per passenger-mile – Transit bus energy use divided by transit bus passenger-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 7.9.

3.5.2 Intercity

Energy use – See Section 2. Energy Use Sources. Because the data past 2000 are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2016*, was used to estimate the change in energy use.

3.5.3 School

Number of vehicles – DOT, FHWA, Highway Statistics 2016, Table MV-10.

Energy use – See Section 2. Energy Use Sources. Because the data past 2000 are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2016*, was used to estimate the change in energy use.

3.6 AIR

3.6.1 Certificated Air Carriers

Aircraft-miles, passenger-miles – DOT, BTS, U.S. Air Traffic Statistics Through December 2017, www.transtats.bts.gov, Washington, DC.

Load factor – Passenger-miles divided by aircraft-miles.

Energy intensities –

Btu per passenger-mile – Certificated air carrier energy use divided by passenger-miles.
Energy use – See Section 2. Energy Use Sources. All of domestic fuel use and half of international fuel use was considered to be domestic use.

Note: These data differ from the data in Table 9.2 because that table contains data on ALL domestic AND international air carrier energy use and passenger-miles.

3.6.2 General Aviation

Number of vehicles – DOT, FAA, *General Aviation and Air Taxi Activity Surveys - CY 2016*. 2011 Data: *Aviation Forecasts*, Tables 28 and 29, May 2013. Data series shown in Table 9.3.

Energy intensities –

Btu per passenger-mile – General aviation energy use divided by passenger-miles. Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.3.

3.7 RECREATIONAL BOATING

Number of vehicles and energy use – U.S. EPA's MOVES2014a model.

3.8 RAIL

3.8.1 Intercity

Number of vehicles, vehicle-miles, passenger-miles – AAR, *Railroad Facts, 2017 Edition*, Washington, DC, 2017.

Load factor – Passenger-miles divided by vehicle-miles.

Energy Intensities –

Btu per vehicle-mile – Intercity rail energy use divided by vehicle-miles.

Btu per passenger-mile – Intercity rail energy use divided by passenger-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.10.

3.8.2 Transit

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2017. Sum of light and heavy rail transit. Data series shown on Table 9.12. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities -

Btu per vehicle-mile – Light and heavy transit rail energy use divided by vehicle-miles. *Btu per passenger-mile* – Light and heavy transit rail energy use divided by passenger-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.12.

3.8.3 Commuter

Number of vehicles, vehicle-miles, passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2017. Data series shown on Table 9.11. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

Load factor – Passenger-miles divided by vehicle-miles.

Energy intensities –

Btu per vehicle-mile – Commuter rail energy use divided by vehicle-miles.

Btu per passenger-mile – Commuter rail energy use divided by passenger-miles. **Energy use** – See Section 2. Energy Use Sources. Data series shown in Table 9.11.

4. HIGHWAY PASSENGER MODE ENERGY INTENSITIES

4.1 CARS

Btu per vehicle-mile – Car energy use divided by car vehicle miles of travel. *Energy use* – See Section 2. Energy Use Sources. Data series shown in Table 2.9. *Vehicle-miles* – 1970-2008: DOT, FHWA, *Highway Statistics 2009*, Table VM-1 and annual editions back to 1996 and DOT, FHWA, *Highway Statistics Summary to 1995*. Data series shown in Table 4.1.
2009-2016: See Appendix A, Section 7. Car and Light Truck Shares.
Btu per passenger-mile – Car energy use divided by car passenger-miles. *Energy use* – See Section 2. Energy Use Sources. Data series shown in Table 2.9. *Passenger miles* – Vehicle miles multiplied by an average load factor. *Vehicle-miles* – 1970-2008: DOT, FHWA, *Highway Statistics 2009*, Table VM-1 and annual editions back to 1996 and DOT, FHWA, *Highway Statistics 2009*, Table VM-1 and annual editions back to 1996 and DOT, FHWA, *Highway Statistics Summary to*

1995. Data series shown in Table 4.1.

2009-2015: See Appendix A, Section 7. Car and Light Truck Shares.

Load factor – NPTS 1969, 1977, 1983/84, 1990, and 1995; NHTS 2001, 2009, and 2017. Data series shown in Table A.18.

| Year | Source | Load Factor |
|------|--------------|-------------|
| 1970 | 1969 NPTS | 1.90 |
| 1971 | Interpolated | 1.90 |
| 1972 | Interpolated | 1.90 |
| 1973 | Interpolated | 1.90 |
| 1974 | Interpolated | 1.90 |
| 1975 | Interpolated | 1.90 |
| 1976 | Interpolated | 1.90 |
| 1977 | 1977 NPTS | 1.90 |
| 1978 | Interpolated | 1.88 |
| 1979 | Interpolated | 1.87 |
| 1980 | Interpolated | 1.85 |

 Table A.19

 Light Truck Load Factor used to Calculate Passenger-Miles

Btu per passenger-mile – Light truck energy use divided by light trucks passenger-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 2.9.
 Passenger miles – Vehicle miles multiplied by an average load factor.
 Vehicle-miles – 1970-2008: DOT, FHWA, Highway Statistics 2009, Table VM-1 and annual editions back to 1996 and DOT, FHWA, Highway Statistics Summary to

1995. Data series shown in Table 4.2.

2009-2015: See Appendix A, Section 7. Car and Light Truck Shares.

Load factor – NPTS 1969, 1977, 1983/84, 1990, and 1995; NHTS 2001, 2009, and 2017. Data series shown in Table A.19.

4.3 Buses

4.3.1 Transit

Btu per vehicle-mile – Transit bus energy use divided by transit bus vehicle-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 7.9.
 Vehicle-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2018.
 Data series shown on Table 7.9. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

Btu per passenger-mile – Transit bus energy use divided by transit bus passenger-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 7.9.
 Passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2016. Data series shown on Table 7.9. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

4.3.2 Intercity

Btu per passenger-mile – Data are not available.

Energy use – See Section 2. Energy Use Sources. Because the data past 2000 are not available, the rate of change in bus VMT from FHWA, *Highway Statistics 2016*, was used to estimate the change in energy use.

Passenger-miles – Data are not available.

5. NONHIGHWAY MODE ENERGY INTENSITIES

5.1 AIR

5.1.1 Certificated Air Carriers

Btu per passenger-mile – Certificated air carrier energy use divided by passenger-miles. Energy use – See Section 2. Energy Use Sources. All of domestic fuel use and half of international fuel use was considered to be domestic use.

Passenger-miles – DOT, BTS, Air Carrier Traffic Statistics, Washington, DC, www.transtats.bts.gov. Pre-1994 data are from various editions of the FAA Statistical Handbook of Aviation (no longer published). Scheduled service passenger-miles of domestic air carriers and half of international air carriers were used to coincide with fuel use.

Note: These data differ from the data in Table 9.2 because that table contains data on ALL domestic AND international air carrier energy use and passenger-miles.

5.1.2 General Aviation

Btu per passenger-mile – Data are not available.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.3. *Passenger-miles* – Data are not available.

5.2 RAIL

5.2.1 Intercity

Btu per passenger-mile – Intercity rail energy use divided by passenger-miles. Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.10. Passenger-miles – AAR, Railroad Facts, 2017 Edition, and previous annual editions.

5.2.2 Transit

Btu per passenger-mile – Transit rail energy use divided by passenger-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.12.
 Passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2017. Data series shown on Table 9.12. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

5.2.3 Commuter

Btu per passenger-mile – Commuter rail energy use divided by passenger-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.11.
 Passenger-miles – APTA, 2017 Public Transportation Fact Book, Washington, DC, 2018. Data series shown on Table 9.11. Data for 2016 are directly from the U.S. Department of Transportation, Federal Transit Administration, National Transit Database.

6. FREIGHT MODE ENERGY INTENSITIES

6.1 TRUCK

Btu per vehicle-mile – Heavy single-unit and combination truck energy use divided by vehicle miles

Energy use – See Section 2. Energy Use Sources (medium/heavy trucks).

Vehicle-miles – DOT, FHWA, Highway Statistics 2016, Table VM-1 and annual editions back to 1996 and DOT, FHWA, Highway Statistics Summary to 1995. Data series is the total of vehicle travel data on Tables 5.1 and 5.2.

6.2 RAIL

Btu per freight car-mile – Class I rail energy use divided by freight car-miles.
 Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.8.
 Freight car miles – AAR, Railroad Facts, 2017 Edition, Washington, DC, 2017. Data series shown in Table 9.8.

Btu per ton-mile – Class I rail energy use divided by ton-miles.

Energy use – See Section 2. Energy Use Sources. Data series shown in Table 9.8.
 Ton-miles – AAR, *Railroad Facts, 2017 Edition*, Washington, DC, 2017. Data series shown in Table 9.8.

6.3 WATER

- **Btu per ton-mile** Domestic waterborne commerce energy use on taxable waterways divided by ton-miles on taxable waterways.
 - Energy use Modeled by Chrisman A. Dager, University of Tennessee, Knoxville, using Waterborne Commerce Statistics Center detail records and annual IRS reports on the Inland Waterway Trust Fund tax on diesel fuel used on the inland waterway. Note: These data are not available for 2015 or 2016.
 - *Ton-miles* Based on detailed records from the U.S. Department of the Army, Army Corps of Engineers, Waterborne Commerce Statistics Center. Includes only ton-miles on taxable waterways.

7. CAR AND LIGHT TRUCK SHARES

In 2011, the Federal Highway Administration (FHWA) changed the methodology for producing the data on the VM-1 Table in the annual *Highway Statistics* publication. Historically, VM-1 included individual categories for passenger cars and 2-axle, 4-tire trucks. VM-1 included the vehicle miles of travel (VMT), registrations, fuel use, and fuel economy of passenger cars and 2-axle, 4-tire trucks. After the methodology change, the categories of light vehicles on VM-1 changed to Light-Duty Vehicles with Short wheelbase (less than or equal to 121 inches) and Light-Duty Vehicles with Long Wheelbase (over 121 inches). As some passenger cars have long wheelbases and some 2-axle, 4-tire trucks have short wheelbases, the categories of cars and 2-axle, 4-tire trucks are no longer available. Despite these changes, there are many transportation analysts who require information on cars and 2-axle, 4-tire trucks. Thus, a new methodology to estimate the data in these categories was developed for years 2009 through 2016.

7.1 CARS

Registrations – DOT, FHWA, *Highway Statistics 2016*, Table MV-1 and annual editions back to 2009.

Vehicle travel -

Total for all light vehicles – DOT, FHWA, *Highway Statistics 2016*, Table VM-1 and annual editions back to 2009; sum of light-duty short wheelbase and light-duty long wheelbase VMT.

Cars – Using historical shares of passenger cars/2-axle, 4-tire trucks from the *Highway Statistics*, the percent of light vehicle travel attributable to cars was estimated for 2009-2016, keeping in mind the economic conditions present in those years and the general trend in total light vehicle VMT. The estimated share was applied to total VMT as shown in Table A.20.

| | Total Light Vehicle | Share Attributable to | Total Car |
|------|---------------------|-----------------------|----------------|
| Year | VMT (billions) | Cars | VMT (billions) |
| 2009 | 2,633.3 | 59.5% | 1,566.8 |
| 2010 | 2,648.5 | 56.5% | 1,496.4 |
| 2011 | 2,650.5 | 55.0% | 1,457.8 |
| 2012 | 2,664.1 | 54.0% | 1,438.6 |
| 2013 | 2,677.8 | 54.0% | 1,446.0 |
| 2014 | 2,710.6 | 53.0% | 1,436.6 |
| 2015 | 2,779.7 | 52.0% | 1,445.4 |
| 2016 | 2,849.7 | 51.0% | 1,453.4 |

Table A.20Estimated Car VMT

Miles per Vehicle – Vehicle travel divided by registrations.

Fuel Use – Vehicle travel divided by fuel economy.

Fuel Economy – DOE, EIA, *Annual Energy Outlook 2018*, January 2018 and annual editions back to 2012.

7.2 2-AXLE, 4-TIRE TRUCKS

Registrations – DOT, FHWA, *Highway Statistics 2016*, Table MV-1 and annual editions back to 2009.

Vehicle travel -

- *Total for all light vehicles* DOT, FHWA, *Highway Statistics 2016*, Table VM-1 and annual editions back to 2009; sum of light-duty short wheelbase and light-duty long wheelbase VMT.
- **2-axle, 4-tire truck VMT** Using historical shares of passenger cars/2-axle, 4-tire trucks from the *Highway Statistics*, the percent of light vehicle travel attributable to cars was estimated for 2009-2016, keeping in mind the economic conditions present in those years and the general trend in total light vehicle VMT. The estimated share was applied to total VMT as shown in Table A.21.

| Year | Total Light Vehicle VMT (billions) | Share Attributable to 2-axle, 4-tire Trucks | Total 2-axle, 4-tire Truck VMT (billions) |
|------|---------------------------------------|---|--|
| 2009 | 2,633.2 | 40.5% | 1,066.5 |
| 2010 | 2,648.5 | 43.5% | 1,152.1 |
| 2011 | 2,650.5 | 45.0% | 1,192.7 |
| 2012 | 2,664.1 | 46.0% | 1,225.5 |
| 2013 | 2,677.8 | 46.0% | 1,231.8 |
| 2014 | 2,710.6 | 47.0% | 1,274.0 |
| 2015 | 2,779.7 | 48.0% | 1,334.3 |
| 2016 | 2,849.7 | 49.0% | 1,396.4 |

Table A.21Estimated 2-axle, 4-tire Truck VMT

Miles per Vehicle – Vehicle travel divided by registrations.

Fuel Use – Vehicle travel divided by fuel economy.

Fuel Economy – DOE, EIA, *Annual Energy Outlook 2018*, January 2018 and annual editions back to 2012.

APPENDIX B

CONVERSIONS

CONVERSIONS

A Note about Heating Values

The heat content of a fuel is the quantity of energy released by burning a unit amount of that fuel. However, this value is not absolute and can vary according to several factors. For example, empirical formulae for determining the heating value of liquid fuels depend on the fuels' American Petroleum Institute (API) gravity. The API gravity varies depending on the percent by weight of the chemical constituents and impurities in the fuel, both of which are affected by the combination of raw materials used to produce the fuel and by the type of manufacturing process. Temperature and climatic conditions are also factors.

Because of these variations, the heating values in Table B.4 may differ from values in other publications. The figures in this report are representative or average values, not absolute ones. The gross (higher) heating values used here agree with those used by the Energy Information Administration (EIA).

Heating values fall into two categories, usually referred to as "higher" (or gross) and "lower" (or net). If the products of fuel combustion are cooled back to the initial fuel-air or fuel-oxidizer mixture temperature and the water formed during combustion is condensed, the energy released by the process is the higher (gross) heating value. If the products of combustion are cooled to the initial fuel-air temperature, but the water is considered to remain as a vapor, the energy released by the process is the lower (net) heating value. Usually the difference between the gross and net heating values for fuels used in transportation is around 5 to 8 percent; however, it is important to be consistent in their use.

The Transportation Energy Data Book has always used gross heating values for fuel conversion.

| 1 kilogram hydrogen = | | |
|-----------------------|---------------------|--|
| Higher heating value | Lower heating value | |
| 134,200 Btu | 113,400 Btu | |
| 39.3 kWhr | 33.2 kWhr | |
| 141,600 kJ | 119,600 kJ | |
| 33,800 kCal | 28,560 kCal | |

Conversion of Constant Dollar Values

Many types of information in this data book are expressed in dollars. Generally, constant dollars are used-that is, dollars of a fixed value for a specific year, such as 2010 dollars. Converting current dollars to constant dollars, or converting constant dollars for one year to constant dollars for another year, requires conversion factors (Table B.17 and Table B.18). Table B.17 shows conversion factors for the Consumer Price Index inflation factors. Table B.18 shows conversion factors using the Gross National Product Implicit Price Deflator.

U.S. Department of Commerce, Bureau of Economic Analysis, Survey of Current Business, Washington, DC, monthly.

GLOSSARY

- Acceleration power Often measured in kilowatts. Pulse power obtainable from a battery used to accelerate a vehicle. This is based on a constant current pulse for 30 seconds at no less than 2/3 of the maximum open-circuit-voltage, at 80% depth-of-discharge relative to the battery's rated capacity and at 20° C ambient temperature.
- Age The amount of time a person or thing has existed.
- Air Carrier The commercial system of air transportation consisting of certificated air carriers, air taxis (including commuters), supplemental air carriers, commercial operators of large aircraft, and air travel clubs.

Certificated route air carrier: An air carrier holding a Certificate of Public Convenience and Necessity issued by the Department of Transportation to conduct scheduled interstate services. Nonscheduled or charter operations may also be conducted by these carriers. These carriers operate large aircraft (30 seats or more, or a maximum payload capacity of 7,500 pounds or more) in accordance with Federal Aviation Regulation part 121.

Domestic air operator: Commercial air transportation within and between the 50 States and the District of Columbia. Includes operations of certificated route air carriers, Pan American, local service, helicopter, intra-Alaska, intra-Hawaii, all-cargo carriers and other carriers. Also included are transborder operations conducted on the domestic route segments of U.S. air carriers. Domestic operators are classified based on their operating revenue as follows:

Majors - over \$1 billion Nationals - \$100 million to \$1 billion Large Regionals - \$20 million to \$99 million Medium Regionals – Less than \$20 million

International air operator: Commercial air transportation outside the territory of the United States, including operations between the U.S. and foreign countries and between the U.S. and its territories and possessions.

Supplemental air carrier: A class of air carriers which hold certificates authorizing them to perform passenger and cargo charter services supplementing the scheduled service of the certificated route air carriers. Supplemental air carriers are often referred to as nonscheduled air carriers or "nonskeds."

Alcohol – The family name of a group of organic chemical compounds composed of carbon, hydrogen, and oxygen. The molecules in the series vary in chain length and are composed of a hydrocarbon plus a hydroxyl group. Alcohol includes methanol and ethanol.

- Alternative fuel For transportation applications, includes the following: methanol; denatured ethanol, and other alcohols; fuel mixtures containing 85 percent or more by volume of methanol, denatured ethanol, and other alcohols with gasoline or other fuels; natural gas; liquefied petroleum gas (propane); hydrogen; coal-derived liquid fuels; fuels (other than alcohol) derived from biological materials (biofuels such as soy diesel fuel); and electricity (including electricity from solar energy). The term "alternative fuel" does not include alcohol or other blended portions of primarily petroleum-based fuels used as oxygenates or extenders, i.e. MTBE, ETBE, other ethers, and the 10-percent ethanol portion of gasohol.
- Amtrak See Rail.
- Anthropogenic Human made. Usually used in the context of emissions that are produced as the result of human activities.
- Aviation See *General aviation*.
- Aviation gasoline All special grades of gasoline for use in aviation reciprocating engines, as given in the American Society for Testing and Materials (ASTM) Specification D 910. Includes all refinery products within the gasoline range that are to be marketed straight or in blends as aviation gasoline without further processing (any refinery operation except mechanical blending). Also included are finished components in the gasoline range which will be used for blending or compounding into aviation gasoline.
- **Barges** Shallow, non-self-propelled vessels used to carry bulk commodities on the rivers and the Great Lakes.
- **Battery efficiency** Measured in percentage. Net DC energy delivered on discharge, as a percentage of the total DC energy required to restore the initial state-of-charge. The efficiency value must include energy losses resulting from self-discharge, cell equalization, thermal loss compensation, and all battery-specific auxiliary equipment.
- Btu British thermal unit. The amount of energy required to raise the temperature of 1 pound of water 1 degree Fahrenheit at or near 39.2 degrees Fahrenheit. An average Btu content of fuel is the heat value per quantity of fuel as determined from tests of fuel samples.
- **Bunker** A storage tank.
- **Bunker fuels** Fuel supplied to ships and aircraft, both domestic and foreign, consisting primarily of residual and distillate fuel oil for ships and kerosene-based jet fuel for aircraft.
- **Bus** –A mode of transit service characterized by roadway vehicles powered by diesel, gasoline, battery, or alternative fuel engines contained within the vehicle.

Intercity bus: A standard size bus equipped with front doors only, high backed seats, luggage compartments separate from the passenger compartment and usually with restroom facilities, for high-speed long distance service.

Motor bus: Rubber-tired, self-propelled, manually-steered bus with fuel supply on board the vehicle. Motor bus types include intercity, school, and transit.

School and other nonrevenue bus: Bus services for which passengers are not directly charged for transportation, either on a per passenger or per vehicle basis.

Transit bus: A bus designed for frequent stop service with front and center doors, normally with a rear-mounted diesel engine, low-back seating, and without luggage storage compartments or restroom facilities.

Trolley coach: Rubber-tired electric transit vehicle, manually-steered, propelled by a motor drawing current, normally through overhead wires, from a central power source not on board the vehicle.

Calendar year – The period of time between January 1 and December 31 of any given year.

Captive imports – Products produced overseas specifically for domestic manufacturers.

Car size classifications – Size classifications of cars are established by the Environmental Protection Agency (EPA) as follows:

Minicompact – less than 85 cubic feet of passenger and luggage volume.
Subcompact – between 85 to 99 cubic feet of passenger and luggage volume.
Compact – between 100 to 109 cubic feet of passenger and luggage volume.
Midsize – between 110 to 119 cubic feet of passenger and luggage volume.
Large – 120 cubic feet or more of passenger and luggage volume.
Two seater – cars designed primarily to seat only two adults.
Small station wagon – less than 130 cubic feet of passenger and luggage volume.
Mid-size station wagon – between 130 to 159 cubic feet of passenger and luggage

Large station wagon – 160 or more cubic feet of passenger and luggage volume.

- **Carbon dioxide (CO₂)** A colorless, odorless, non-poisonous gas that is a normal part of the ambient air. Carbon dioxide is a product of fossil fuel combustion.
- **Carbon monoxide (CO)** A colorless, odorless, highly toxic gas that is a by-product of incomplete fossil fuel combustion. Carbon monoxide, one of the major air pollutants, can be harmful in small amounts if breathed over a certain period of time.
- Car-mile (railroad) A single railroad car moved a distance of one mile.

Cargo ton-mile – See *Ton-mile*.

Certificated route air carriers – See *Air carriers*.

Class I freight railroad – See Rail.

Coal slurry – Finely crushed coal mixed with sufficient water to form a fluid.

- **Combination trucks** Consist of a power unit (a truck tractor) and one or more trailing units (a semi-trailer or trailer). The most frequently used combination is popularly referred to as a "tractor-semitrailer" or "tractor trailer."
- **Commercial sector** An energy-consuming sector that consists of service-providing facilities of: businesses; Federal, State, and local governments; and other private and public organizations, such as religious, social or fraternal groups. Includes institutional living quarters.
- **Commuter rail** A mode of transit service (also called metropolitan rail, regional rail, or suburban rail) characterized by an electric or diesel propelled railway for urban passenger train service consisting of local short distance travel operating between a central city and adjacent suburbs.
- **Compact car** See *car size classifications*.
- **Compression ignition** The form of ignition that initiates combustion in a diesel engine. The rapid compression of air within the cylinders generates the heat required to ignite the fuel as it is injected.
- **Constant dollars** A time series of monetary figures is expressed in constant dollars when the effect of change over time in the purchasing power of the dollar has been removed. Usually the data are expressed in terms of dollars of a selected year or the average of a set of years.
- **Consumer Price Index (CPI)** A measure of the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services.
- **Continuous discharge capacity** Measured as percent of rated energy capacity. Energy delivered in a constant power discharge required by an electric vehicle for hill climbing and/or high-speed cruise, specified as the percent of its rated energy capacity delivered in a one hour constant-power discharge.
- **Conventional Refueling Station** An establishment for refueling motor vehicles with traditional transportation fuels, such as gasoline and diesel fuel.
- **Corporate Average Fuel Economy (CAFE) Standards** CAFE standards were originally established by Congress for new cars, and later for light-duty trucks, in Title V of the Motor Vehicle Information and Cost Savings Act (15 U.S.C.1901, et seq.) with subsequent amendments. Under CAFE, car manufacturers are required by law to produce vehicle fleets with a composite sales-weighted fuel economy which cannot be lower than the CAFE standards in a given year, or for every vehicle which does not meet the standard, a fine of \$5.00 is paid for every one-tenth of a mpg below the standard.
- **Criteria pollutant** A pollutant determined to be hazardous to human health and regulated under EPA's National Ambient Air Quality Standards. The 1970 amendments to the Clean Air Act require EPA to describe the health and welfare impacts of a pollutant as the "criteria" for inclusion in the regulatory regime.

- **Crude oil** A mixture of hydrocarbons that exists in the liquid phase in natural underground reservoirs and remains liquid at atmospheric pressure after passing through surface separating facilities. Crude oil production is measured at the wellhead and includes lease condensate.
- **Crude oil imports** The volume of crude oil imported into the 50 States and the District of Columbia, including imports from U.S. territories, but excluding imports of crude oil into the Hawaiian Foreign Trade Zone.
- **Curb weight** The weight of a vehicle including all standard equipment, spare tire and wheel, all fluids and lubricants to capacity, full tank of fuel, and the weight of major optional accessories normally found on the vehicle.
- **Current dollars** Represents dollars current at the time designated or at the time of the transaction. In most contexts, the same meaning would be conveyed by the use of the term "dollars." See also constant dollars.
- **Demand Response** A transit mode that includes passenger cars, vans, and small buses operating in response to calls from passengers to the transit operator who dispatches the vehicles. The vehicles do not operate over a fixed route on a fixed schedule. Can also be known as paratransit or dial-a-ride.

Diesel fuel – See *Distillate fuel oil*.

Disposable personal income – See *Income*.

Distillate fuel oil – The lighter fuel oils distilled off during the refining process. Included are products known as ASTM grades numbers 1 and 2 heating oils, diesel fuels, and number 4 fuel oil. The major uses of distillate fuel oils include heating, fuel for on-and off-highway diesel engines, and railroad diesel fuel.

Domestic air operator – See *Air carrier*.

- **Domestic water transportation** See Internal water transportation.
- E85 85% ethanol and 15% gasoline.
- **E95** 95% ethanol and 5% gasoline.
- **Electric utilities sector** Consists of privately and publicly owned establishments which generate electricity primarily for resale.
- **Emission standards** Limits or ranges established for pollution levels emitted by vehicles as well as stationary sources. The first standards were established under the 1963 Clean Air Act.

End-use sector – See Sector.

Energy capacity – Often measured in kilowatt hours. The energy delivered by the battery up to termination of discharge specified by the battery manufacturer.

- **Energy efficiency** In reference to transportation, the inverse of energy intensiveness: the ratio of outputs from a process to the energy inputs; for example, miles traveled per gallon of fuel (mpg).
- **Energy intensity** In reference to transportation, the ratio of energy inputs to a process to the useful outputs from that process; for example, gallons of fuel per passenger-mile or Btu per ton-mile.
- **Ethanol (C₂H₅OH)** Otherwise known as ethyl alcohol, alcohol, or grain-spirit. A clear, colorless, flammable oxygenated hydrocarbon with a boiling point of 78.5 degrees Celsius in the anhydrous state. In transportation, ethanol is used as a vehicle fuel by itself (E100 100% ethanol by volume), blended with gasoline (E85 85% ethanol by volume), or as a gasoline octane enhancer and oxygenate (10% by volume).
- Excise tax Paid when purchases are made on a specific good, such as gasoline. Excise taxes are often included in the price of the product. There are also excise taxes on activities, such as highway usage by trucks.
- **Ferry boat** A transit mode comprising vessels carrying passengers and in some cases vehicles over a body of water, and that are generally steam or diesel-powered.

Fixed operating cost – See *Operating cost*.

Fleet vehicles -

Private fleet vehicles: Ideally, a vehicle could be classified as a member of a fleet if it is: a) operated in mass by a corporation or institution,

- b) operated under unified control, or
- c) used for non-personal activities.

However, the definition of a fleet is not consistent throughout the fleet industry. Some companies make a distinction between cars that were bought in bulk rather than singularly, or whether they are operated in bulk, as well as the minimum number of vehicles that constitute a fleet (i.e. 4 or 10).

Government fleet vehicles: Includes vehicles owned by all Federal, state, county, city, and metro units of government, including toll road operations.

- **Foreign freight** Movements between the United States and foreign countries and between Puerto Rico, the Virgin Islands, and foreign countries. Trade between U.S. territories and possessions (e.g. American Samoa, Guam, North Mariana Islands and U.S. Outlying Islands) and foreign countries is excluded. Traffic to or from the Panama Canal Zone is included, but traffic with U.S. origin and U.S. destination traveling through the Panama Canal is not.
- **Gas Guzzler Tax** Originates from the 1978 Energy Tax Act (Public Law 95-618). A new car purchaser is required to pay the tax if the car purchased has a combined city/highway fuel economy rating that is below the standard for that year. For model years 1986 and later, the standard is 22.5 mpg.

- **Gasohol** A mixture of 10% anhydrous ethanol and 90% gasoline by volume; 7.5% anhydrous ethanol and 92.5% gasoline by volume; or 5.5% anhydrous ethanol and 94.5% gasoline by volume. There are other fuels that contain methanol and gasoline, but these fuels are not referred to as gasohol.
- Gasoline See *Motor gasoline*.
- **General aviation** That portion of civil aviation which encompasses all facets of aviation except air carriers. It includes any air taxis, commuter air carriers, and air travel clubs which do not hold Certificates of Public Convenience and Necessity.
- **Global warming potential (GWP)** An index used to compare the relative radiative forcing of different gases without directly calculating the changes in atmospheric concentrations. GWPs are calculated as the ratio of the radiative forcing that would result from the emission of one kilogram of a greenhouse gas to that from the emission of one kilogram of carbon dioxide over a fixed period of time, such as 100 years.
- **Greenhouse gases** Those gases, such as water vapor, carbon dioxide, nitrous oxide, methane, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride, that are transparent to solar (short-wave) radiation but opaque to long-wave (infrared) radiation, thus preventing long-wave radiant energy from leaving Earth's atmosphere. The net effect is a trapping of absorbed radiation and a tendency to warm the planet's surface.
- **Gross Domestic Product (GDP)** The market value of goods and services produced by labor and property in the United States, regardless of nationality; gross domestic product replaced gross national product as the primary measure of U.S. production in 1991.
- **Gross National Product (GNP)** A measure of monetary value of the goods and services becoming available to the nation from economic activity. The market value of goods and services produced by labor and property supplied by U.S. residents, regardless of where they are located. Calculated quarterly by the Department of Commerce, the gross national product is the broadest available measure of the level of economic activity.
- **Gross vehicle weight (gvw)** The weight of the empty truck plus the maximum anticipated load weight, including passengers, fluids, and cargo.
- **Gross vehicle weight rating (gvwr)** The gross vehicle weight which is assigned to each new truck by the manufacturer. This rating may be different for trucks of the same model because of certain features, such as heavy-duty suspension. Passenger cars are not assigned gross vehicle weight ratings.
- **Heavy-heavy truck** See *Truck size classifications*.
- **Heavy rail** A mode of transit service (also called metro, subway, rapid transit, or rapid rail) operating on an electric railway with the capacity for a heavy volume of traffic. Characterized by high speed and rapid acceleration of passenger rail cars.

- **Household** Consists of all persons who occupy a housing unit, including the related family members and all unrelated persons, if any, who share the housing unit.
- Housing unit A house, apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have either (1) direct access from the outside of the building or through a common hallway intended to be used by the occupants of another unit or by the general public, or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements.
- **Hybrid-electric vehicles** Combines the benefits of gasoline engines and electric motors and can be configured to obtain different objectives, such as improved fuel economy, increased power, or additional auxiliary power for electronic devices and power tools.
- **Hydrocarbon (HC)** A compound that contains only hydrogen and carbon. The simplest and lightest forms of hydrocarbon are gaseous. With greater molecular weights they are liquid, while the heaviest are solids.

Income -

Disposable personal income: Personal income less personal tax and non-tax payments.

National income: The aggregate earnings of labor and property which arise in the current production of goods and services by the nation's economy.

Personal income: The current income received by persons from all sources, net of contributions for social insurance.

Industrial sector – Construction, manufacturing, agricultural and mining establishments.

Inertia weight – The curb weight of a vehicle plus 300 pounds.

Intercity bus – See Bus.

- Intermodal Transportation activities involving more than one mode of transportation, including transportation connections and coordination of various modes.
- Internal water transportation Includes all local (intraport) traffic and traffic between ports or landings wherein the entire movement takes place on inland waterways. Also termed internal are movements involving carriage on both inland waterways and the water of the Great Lakes, and inland movements that cross short stretches of open water that link inland systems.

International air operator – See *Air carrier*.

International freight – See Foreign freight.

Jet fuel – Includes both naphtha-type and kerosene-type fuels meeting standards for use in aircraft turbine engines. Although most jet fuel is used in aircraft, some is used for other purposes such as generating electricity in gas turbines.

Kerosene-type jet fuel: A quality kerosene product with an average gravity of 40.7 degrees API and 10% to 90% distillation temperatures of 217 to 261 degrees Celsius. Used primarily as fuel for commercial turbojet and turboprop aircraft engines. It is a relatively low freezing point distillate of the kerosene type.

Naphtha-type jet fuel: A fuel in the heavy naphtha boiling range with an average gravity of 52.8 degrees API and 10% to 90% distillation temperatures of 117 to 233 degrees Celsius used for turbojet and turboprop aircraft engines, primarily by the military. Excludes ramjet and petroleum.

Kerosene – A petroleum distillate in the 300 to 500 degrees Fahrenheit boiling range and generally having a flash point higher than 100 degrees Fahrenheit by the American Society of Testing and Material (ASTM) Method D56, a gravity range from 40 to 46 degrees API, and a burning point in the range of 150 to 175 degrees Fahrenheit. It is a clean-burning product suitable for use as an illuminant when burned in wick lamps. Includes grades of kerosene called range oil having properties similar to Number 1 fuel oil, but with a gravity of about 43 degrees API and an end point of 625 degrees Fahrenheit. Used in space heaters, cooking stoves, and water heaters.

Kerosene-type jet fuel – See Jet fuel.

- Large car See Car size classifications.
- Lease Condensate A liquid recovered from natural gas at the well or at small gas/oil separators in the field. Consists primarily of pentanes and heavier hydrocarbons (also called field condensate).
- Light-duty vehicles Cars and light-duty trucks combined.
- Light-duty truck Light-duty trucks are defined differently by different agencies/companies. Therefore, this document does not have one single definition of light-duty trucks. The Environmental Protection Agency defines light-duty trucks size classes as follows:

| Class | Gross Vehicle Weight Rating (GVWR) | | |
|---------------|------------------------------------|--------------------|--|
| Pickup Trucks | Through 2007 | As of 2008 | |
| Small | < 4,500 lbs | < 6,000 lbs | |
| Standard | 4,500 to 8,500 lbs | 6,000 to 8,500 lbs | |
| Vans | Through 2010 | As of 2011 | |
| Passenger | < 8,500 lbs | < 10,000 lbs | |
| Cargo | < 8,500 lbs | | |
| Minivans | < 8,500 lbs | | |
| SUVs | Through 2010 | 2011–12 | |
| All | < 8,500 lbs | < 10,000 lbs | |
| | As of 2013 | | |
| Small | < 6,000 lbs | | |
| Standard | 6,000 to 9,999 lbs | | |

| Special Purpose Vehicles | Through 2010 | As of 2011 |
|--------------------------|--------------|----------------------------|
| | | < 8,500 lbs |
| | < 8,500 lbs | or < 10,000 lbs |
| | | depending on configuration |

Light-heavy truck – See *Truck size classifications*.

- Light rail Mode of transit service (also called streetcar, tramway or trolley) operating passenger rail cars singly (or in short, usually two-car or three-car trains) on fixed rails in right-of-way that is often separated from other traffic for part or much of the way.
- Liquefied petroleum gas (lpg) Consists of propane and butane and is usually derived from natural gas. In locations where there is no natural gas and the gasoline consumption is low, naphtha is converted to lpg by catalytic reforming.
- Load factor Total passenger miles divided by total vehicle miles.
- Low emission vehicle Any vehicle certified to the low emission standards which are set by the Federal government and/or the state of California.
- M85 85% methanol and 15% gasoline.
- **M100** 100% methanol.
- **Medium truck** See *Truck size classifications*.
- Methanol (CH₃OH) A colorless highly toxic liquid with essentially no odor and very little taste. It is the simplest alcohol and boils at 64.7 degrees Celsius. In transportation, methanol is used as a vehicle fuel by itself (M100), or blended with gasoline (M85).
- Midsize car See *Car size classifications*.
- Minicompact car See *Car size classifications*.
- **Model year** In this publication, model year is referring to the "sales" model year, the period from October 1 to the next September 31.

Motor bus – See Bus.

Motor gasoline – A mixture of volatile hydrocarbons suitable for operation of an internal combustion engine whose major components are hydrocarbons with boiling points ranging from 78 to 217 degrees Celsius and whose source is distillation of petroleum and cracking, polymerization, and other chemical reactions by which the naturally occurring petroleum hydrocarbons are converted into those that have superior fuel properties.

Regular gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than or equal to 85 and less than 88. Note: Octane requirements may vary by altitude.

Premium gasoline: Gasoline having an antiknock index, i.e., octane rating, greater than 90. Note: Octane requirements may vary by altitude.

or equal to 88 and less than or equal to 90. Note: Octane requirements may vary by altitude.

Reformulated gasoline: Finished motor gasoline formulated for use in motor vehicles, the composition and properties of which meet the requirements of the reformulated gasoline regulations promulgated by the U.S. Environmental Protection Agency under Section 211(k) of the Clean Air Act. For more details on this clean fuel program see http://www.epa.gov/otaq/fuels/gasolinefuels/rfg/index.htm. Note: This category includes oxygenated fuels program reformulated gasoline (OPRG) but excludes reformulated gasoline blendstock for oxygenate blending (RBOB).

- **MTBE** Methyl Tertiary Butyl Ether–a colorless, flammable, liquid oxygenated hydrocarbon containing 18.15 percent oxygen.
- Naphtha-type jet fuel See *Jet fuel*.
- National income See Income.
- Nationwide Household Travel Survey (NHTS) A nationwide survey of households that provides information on the characteristics and personal travel patterns of the U.S. population. Surveys were conducted in 2001, 2009, and 2017 by the U.S. Bureau of Census for the U.S. Department of Transportation. This is a follow-on to the NPTS.
- Nationwide Personal Transportation Survey (NPTS) A nationwide survey of households that provides information on the characteristics and personal travel patterns of the U.S. population. Surveys were conducted in 1969, 1977, 1983, 1990, and 1995 by the U.S. Bureau of Census for the U.S. Department of Transportation.
- **Natural gas** A mixture of hydrocarbon compounds and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions.

Natural gas, dry: Natural gas which remains after: 1) the liquefiable hydrocarbon portion has been removed from the gas stream; and 2) any volumes of nonhydrocarbon gases have been removed where they occur in sufficient quantity to render the gas unmarketable. Dry natural gas is also known as consumer-grade natural gas. The parameters for measurement are cubic feet at 60 degrees Fahrenheit and 14.73 pounds per square inch absolute.

Natural gas, wet: The volume of natural gas remaining after removal of lease condensate in lease and/or field separation facilities, if any, and after exclusion of nonhydrocarbon gases where they occur in sufficient quantity to render the gas unmarketable. Natural gas liquids may be recovered from volumes of natural gas, wet after lease separation, at natural gas processing plants.

Natural gas plant liquids: Natural gas liquids recovered from natural gas in processing plants and from natural gas field facilities and fractionators. Products obtained include

ethane, propane, normal butane, isobutane, pentanes plus, and other products from natural gas processing plants.

- Nitrogen oxides (NO_x) A product of combustion of fossil fuels whose production increases with the temperature of the process. It can become an air pollutant if concentrations are excessive.
- Nonattainment area Any area that does not meet the national primary or secondary ambient air quality standard established by the Environmental Protection Agency for designated pollutants, such as carbon monoxide and ozone.
- **Oil Stocks** Oil stocks include crude oil (including strategic reserves), unfinished oils, natural gas plant liquids, and refined petroleum products.

Operating cost –

Fixed operating cost: In reference to passenger car operating cost, refers to those expenditures that are independent of the amount of use of the car, such as insurance costs, fees for license and registration, depreciation and finance charges.

Variable operating cost: In reference to passenger car operating cost, expenditures which are dependent on the amount of use of the car, such as the cost of gas and oil, tires, and other maintenance.

Organization for Economic Cooperation and Development (OECD) – Consists of Australia, Austria, Belgium, Canada, Chile, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Luxembourg, Mexico, Netherlands, New Zealand, Norway, Poland, Portugal, Slovak Republic, Slovenia, South Korea, Spain, Sweden, Switzerland, Turkey, United Kingdom, and United States. Total OECD includes the United States Territories (Guam, Puerto Rico, and the U.S. Virgin Islands).

OECD Europe: Consists of Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, Turkey, and United Kingdom.

OECD Pacific: Consists of Australia, Japan, South Korea, and New Zealand.

Organization for Petroleum Exporting Countries (OPEC) – Includes Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, United Arab Emirates, and Venezuela.

Arab OPEC – Consists of Algeria, Bahrain, Egypt, Iraq, Kuwait, Libya, Qatar, Saudi Arabia, Syria, Tunisia, and the United Arab Emirates.

Other single-unit truck – See *Single-unit truck*.

Oxygenate – A substance which, when added to gasoline, increases the amount of oxygen in that gasoline blend. Includes fuel ethanol, methanol, and methyl tertiary butyl ether (MTBE).

- **Paratransit** Mode of transit service (also called demand response or dial-a-ride) characterized by the use of passenger cars, vans or small buses operating in response to calls from passengers or their agents to the transit operator, who then dispatches a vehicle to pick up the passengers and transport them to their destinations.
- Particulates Carbon particles formed by partial oxidation and reduction of the hydrocarbon fuel. Also included are trace quantities of metal oxides and nitrides, originating from engine wear, component degradation, and inorganic fuel additives. In the transportation sector, particulates are emitted mainly from diesel engines.
- **Passenger-miles traveled (PMT)** One person traveling the distance of one mile. Total passenger-miles traveled, thus, give the total mileage traveled by all persons.
- Passenger rail See Rail, "Amtrak" and "Transit Railroad".
- **Persian Gulf countries** Consists of Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, and the United Arab Emirates.
- **Personal Consumption Expenditures (PCE)** As used in the national accounts, the market value of purchases of goods and services by individuals and nonprofit institutions and the value of food, clothing, housing, and financial services received by them as income in kind. It includes the rental value of owner-occupied houses but excludes purchases of dwellings, which are classified as capital goods (investment).

Personal income – See *Income*.

Petroleum – A generic term applied to oil and oil products in all forms, such as crude oil, lease condensate, unfinished oil, refined petroleum products, natural gas plant liquids, and non-hydrocarbon compounds blended into finished petroleum products.

Petroleum consumption: A calculated demand for petroleum products obtained by summing domestic production, imports of crude petroleum and natural gas liquids, imports of petroleum products, and the primary stocks at the beginning of the period and then subtracting the exports and the primary stocks at the end of the period.

Petroleum exports: Shipments of petroleum products from the 50 States and the District of Columbia to foreign countries, Puerto Rico, the Virgin Islands, and other U.S. possessions and territories.

Petroleum imports: All imports of crude petroleum, natural gas liquids, and petroleum products from foreign countries and receipts from Guam, Puerto Rico, the Virgin Islands, and the Hawaiian Trade Zone. The commodities included are crude oil, unfinished oils, plant condensate, and refined petroleum products.

Petroleum inventories: The amounts of crude oil, unfinished oil, petroleum products, and natural gas liquids held at refineries, at natural gas processing plants, in pipelines, at bulk terminals operated by refining and pipeline companies, and at independent bulk terminals. Crude oil held in storage on leases is also included; these stocks are known as primary stocks. Secondary stocks-those held by jobbers dealers, service station operators, and

consumers-are excluded. Prior to 1975, stock held at independent bulk terminals were classified as secondary stocks.

Petroleum products supplied: For each petroleum product, the amount supplied is calculated by summing production, crude oil burned directly, imports, and net withdrawals from primary stocks and subtracting exports.

Plug-in hybrid-electric vehicles (PHEVs) — Hybrid-electric vehicles with high capacity batteries that can be charged by plugging them into an electrical outlet or charging station. There are two basic PHEV configurations:

Parallel or Blended PHEV: Both the engine and electric motor are mechanically connected to the wheels, and both propel the vehicle under most driving conditions. Electric-only operation usually occurs only at low speeds.

Series PHEVs, also called Extended Range Electric Vehicles (EREVs): Only the electric motor turns the wheels; the gasoline engine is only used to generate electricity. Series PHEVs can run solely on electricity until the battery needs to be recharged. The gasoline engine will then generate the electricity needed to power the electric motor. For shorter trips, these vehicles might use no gasoline at all.

- **Processing Gain** The amount by which the total volume of refinery output is greater than the volume of input for given period of time. The processing gain arises when crude oil and other hydrocarbons are processed into products that are, on average, less dense than the input.
- **Processing Loss** The amount by which the total volume of refinery output is less than the volume of input for given period of time. The processing loss arises when crude oil and other hydrocarbons are processed into products that are, on average, denser than the input.
- **Proved Reserves of Crude Oil** The estimated quantities of all liquids defined as crude oil, which geological and engineering data demonstrate with reasonable certainty to be recoverable in future years from known reservoirs under existing economic and operating conditions.
- **Quad** Quadrillion, 10^{15} . In this publication, a Quad refers to Quadrillion Btu.

Rail –

Amtrak (American Railroad Tracks): Operated by the National Railroad Passenger Corporation of Washington, DC. This rail system was created by President Nixon in 1970, and was given the responsibility for the operation of intercity, as distinct from suburban, passenger trains between points designated by the Secretary of Transportation.

Class I freight railroad: Defined by the Interstate Commerce Commission each year based on annual operating revenue. A railroad is dropped from the Class I list if it fails to meet the annual earnings threshold for three consecutive years.

Commuter railroad: Those portions of mainline railroad (not electric railway) transportation operations which encompass urban passenger train service for local travel

between a central city and adjacent suburbs. Commuter railroad service–using both locomotive-hauled and self-propelled railroad passenger cars–is characterized by multi-trip tickets, specific station-to-station fares, and usually only one or two stations in the central business district. Also known as suburban railroad.

Transit railroad: Includes "heavy" and "light" transit rail. **Heavy transit rail** is characterized by exclusive rights-of-way, multi-car trains, high speed rapid acceleration, sophisticated signaling, and high platform loading. Also known as subway, elevated railway, or metropolitan railway (metro). **Light transit rail** may be on exclusive or shared rights-of-way, high or low platform loading, multi-car trains or single cars, automated or manually operated. In generic usage, light rail includes streetcars, trolley cars, and tramways.

- **Refiner sales price** Sales from the refinery made directly to ultimate consumers, including bulk consumers (such as agriculture, industry, and electric utilities) and residential and commercial consumers.
- **Reformulated gasoline (RFG)** See *Motor gasoline*.
- **RFG area** An ozone nonattainment area designated by the Environmental Protection Agency which requires the use of reformulated gasoline.
- **Residential sector** An energy consuming sector that consists of living quarters for private households. Excludes institutional living quarters.
- **Residential Transportation Energy Consumption Survey (RTECS)** This survey was designed by the Energy Information Administration of the Department of Energy to provide information on how energy is used by households for personal vehicles. It has been conducted five times since 1979, the most recent being 1991.
- **Residual fuel oil** The heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are boiled off in refinery operations. Included are products know as ASTM grade numbers 5 and 6 oil, heavy diesel oil, Navy Special Fuel Oil, Bunker C oil, and acid sludge and pitch used as refinery fuels. Residual fuel oil is used for the production of electric power, for heating, and for various industrial purposes.
- **Rural** Usually refers to areas with population less than 5,000.
- Sales period October 1 of the previous year to September 30 of the given year. Approximately the same as a model year.
- Sales-weighted miles per gallon (mpg) Calculation of a composite vehicle fuel economy based on the distribution of vehicle sales.
- Scrappage rate As applied to motor vehicles, it is usually expressed as the percentage of vehicles of a certain type in a given age class that are retired from use (lacking registration) in a given year.

School and other nonrevenue bus – See *Bus*.

- Sector A group of major energy-consuming components of U.S. society developed to measure and analyze energy use. The sectors most commonly referred to are: residential, commercial, industrial, transportation, and electric power.
- Single-unit truck Includes two-axle, four-tire trucks and other single-unit trucks.

Two-axle, four-tire truck: A motor vehicle consisting primarily of a single motorized device with two axles and four tires.

Other single-unit truck: A motor vehicle consisting primarily of a single motorized device with more than two axles or more than four tires.

- **Spark ignition engine** An internal combustion engine in which the charge is ignited electrically (e.g., with a spark plug).
- **Special fuels** Consist primarily of diesel fuel with small amount of liquefied petroleum gas, as defined by the Federal Highway Administration.
- **Specific acceleration power** Measured in watts per kilogram. Acceleration power divided by the battery system weight. Weight must include the total battery system.
- **Specific energy** Measured in watt hours per kilogram. The rated energy capacity of the battery divided by the total battery system weight.
- **Subcompact car** See *Car size classifications*.
- Supplemental air carrier See *Air carrier*.
- Survival rate As applied to motor vehicles, it is usually expressed as the percentage of vehicles of a certain type in a given age class that will be in use at the end of a given year.
- **Tax incentives** In general, a means of employing the tax code to stimulate investment in or development of a socially desirable economic objective without direct expenditure from the budget of a given unit of government. Such incentives can take the form of tax exemptions or credits.
- **Test weight** The weight setting at which a vehicle is tested on a dynamometer by the U.S. Environmental Protection Agency (EPA). This weight is determined by the EPA using the inertia weight of the vehicle.
- **Ton-mile** The movement of one ton of freight the distance of one mile. Ton-miles are computed by multiplying the weight in tons of each shipment transported by the distance hauled.

Transmission types -

A3 – Automatic three speed
A4 – Automatic four speed
A5 – Automatic five speed
L4 – Automatic lockup four speed
M5 – Manual five speed

Transit bus – See Bus.

Transit railroad – See Rail.

- **Transportation sector** Consists of both private and public passenger and freight transportation, as well as government transportation, including military operations.
- **Truck Inventory and Use Survey (TIUS)** Survey designed to collect data on the characteristics and operational use of the nation's truck population. It is conducted every five years by the U.S. Bureau of the Census. Surveys were conducted in 1963, 1967, 1972, 1977, 1982, 1987, and 1992. For the 1997 survey, it was renamed the Vehicle Inventory and Use Survey in anticipation of including additional vehicle types. However, no additional vehicle types were added to the 1997 survey.
- **Trolleybus** Mode of transit service (also called transit coach) using vehicles propelled by a motor drawing current from overhead wires via connecting poles called a trolley pole, from a central power source not onboard the vehicle.
- **Truck size classifications** U.S. Bureau of the Census has categorized trucks by gross vehicle weight (gvw) as follows:

Light – Less than 10,000 pounds gvw (Also see *Light-duty truck*.) Medium – 10,001 to 20,000 pounds gvw Light-heavy – 20,001 to 26,000 pounds gvw Heavy-heavy – 26,001 pounds gvw or more.

Two-axle, four-tire truck – See *Single-unit truck*.

Two-seater car – See *Car size classifications*.

- **Ultra-low emission vehicle** Any vehicle certified to the ultra-low emission standards which are set by the Federal government and/or the state of California.
- Urban Usually refers to areas with population of 5,000 or greater.
- **Vanpool:** A ridesharing prearrangement using vans or small buses providing round-trip transportation between the participant's prearranged boarding points and a common and regular destination.
- Variable operating cost See Operating cost.
- Vehicle Inventory and Use Survey Last conducted in 2002. See Truck Inventory and Use Survey.

TRANSPORTATION ENERGY DATA BOOK: EDITION 37-2018

- **Vehicle-miles traveled (vmt)** One vehicle traveling the distance of one mile. Total vehicle miles, thus, is the total mileage traveled by all vehicles.
- **Volatile organic compounds (VOCs)** Organic compounds that participate in atmospheric photochemical reactions.

Waterborne Commerce -

Coastwise: Domestic traffic receiving a carriage over the ocean, or the Gulf of Mexico. Traffic between Great Lakes ports and seacoast ports, when having a carriage over the ocean, is also termed Coastwise.

Domestic: Includes coastwise, lakewise, and internal waterborne movements.

Foreign: Waterborne import, export, and in-transit traffic between the United States, Puerto Rico and the Virgin Islands and any foreign country.

Internal: Vessel movements (origin and destination) which take place solely on inland waterways. An inland waterway is one geographically located within the boundaries of the contiguous 48 states or within the boundaries of the State of Alaska.

Lakewise: Waterborne traffic between the United States ports on the Great Lakes System. The Great Lakes System is treated as a separate waterway system rather than as a part of the inland waterway system. In comparing historical data for the Great Lakes System, one should note that prior to calendar year 1990, marine products, sand and gravel being moved from the Great Lakes to Great Lake destinations were classified as local traffic. From 1990-on, these activities are classified as lakewise traffic.

- **Well-to-wheel** A life cycle analysis used in transportation to consider the entire energy cycle for a given mode, rather than just tailpipe emissions. The analysis starts at the primary energy source and ends with the turning wheels of the vehicle.
- **Zero-emission vehicle** Any vehicle certified to the zero emission standards which are set by the Federal government and/or the state of California. These standards apply to the vehicle emissions only.
